EXECUTIVE SUMMARY

Background

The Boston CHNA-CHIP Collaborative is a new initiative created by a number of stakeholders—community organizations, health centers, community development corporations, hospitals, and the Boston Public Health Commission. It aims to undertake the first large-scale collaborative city-wide Community Health Needs Assessment (CHNA) and Community Health Improvement Planning (CHIP) process.

The goals of the CHNA are to:

- Systematically identify the health-related needs, strengths, and resources of a community to inform future planning,
- Understand the current health status of Boston overall and its sub-populations within their social context, and
- Meet regulatory requirements for a number of institutions, organizations, and agencies (e.g., IRS requirements for non-profit hospitals, PHAB for health departments).

To support this effort, the Collaborative hired Health Resources in Action (HRiA), a non-profit public health organization, as a consultant partner to provide strategic guidance and facilitation of the process, collect and analyze data, and develop the report deliverables.

Approach and Methods

This CHNA focuses on the social determinants of health using a health equity lens. The influences of race, ethnicity, income, and geography on health patterns are often intertwined. In the United States, social, economic, and political processes ascribe social status based on race and ethnicity, which may influence opportunities for educational and occupational advancement and housing options, two factors that profoundly affect health. Institutional racism, economic inequality, discriminatory policies, and historical oppression of specific groups are many of the root factors that drive the health inequities we see in the U.S. today.

Social Determinants of Health Framework

World Health Organization, Commission on the Social Determinants of Health, Towards a Conceptual Framework for Analysis and Action on the Social Determinants of Health, 2005.

The CHNA used a participatory, collaborative approach that engaged the community through different avenues. Over 100 Collaborative members representing health care, public health, education, community development, social service, and community-based organizations provided input throughout the CHNA process and played an integral role in data collection efforts. Data collection efforts were focused on engaging hard-to-reach populations who are not typically engaged in these processes or represented in the secondary data.

Existing data were drawn from national, state, and city sources, such as the U.S. Census, Massachusetts Department of Public Health, and Boston Public Health Commission, including datasets such as the Boston Behavioral Risk Factor Surveillance System (BBRFSS). For new data collection, over 91 organizations and 2,500 individuals were engaged in a CHNA community survey (N=2,404) administered online and in-person in seven languages, 13 focus groups with community residents (N=104), and 45 interviews with organizational and community leaders to gauge their perceptions of the community's needs, strengths, and opportunities.

Like all data gathering efforts, there are limitations to the CHNA data. Secondary data have a time lag, and various sources may use different definitions for similar topics. Data may be aggregated across time, geographies, or population groups to provide large enough sample sizes. More granular analysis for specific neighborhoods or ethnic groups within larger racial/ethnic categories is not possible. Primary data such as the survey and focus groups use a convenience sample which may not be representative of the larger population.

Population Characteristics

Who lives in Boston?

Boston is a young, diverse city that continues to experience population and economic growth that varies by neighborhood and race/ethnicity. Despite an economic upturn in recent years, residents experience disparities in employment and financial security – particularly residents of color and those with lower levels of education – resulting in greater economic inequality.

Racial, Ethnic, Cultural, and Language Diversity

Understanding the racial, ethnic, cultural and language profiles of Boston helps to provide context for health status and the structural, discriminatory, and social factors that contribute to health inequities. Boston is a diverse city with 23% of residents identifying as Black, nearly 20% identifying as Latino, and nearly 10% identifying as Asian. Boston also has a large immigrant community. One-third of Boston residents speak a language other than English at home, the most prevalent language being Spanish. Diversity among younger residents is greater than among older residents, and population composition by neighborhood varies substantially. Black residents comprise a larger portion of the population in Mattapan, Dorchester, Roxbury, and Hyde Park; Latino residents comprise over half the population in East Boston and experienced the largest population growth of all racial and ethnic groups; the South End, Fenway, and Allston/Brighton have the highest proportion of Asian residents.

Education

Education affects health in multiple ways because it increases economic and social resources. Education was seen by Boston CHNA survey respondents as a key component of a healthy community (45% of survey respondents reported access to good education as an important factor that defines a healthy community). While statistics point to a well-educated community (48% of Boston adults have a college degree or more), there are substantial differences across racial and ethnic groups, whereas a higher proportion of White and Asian adults have college degrees or more (70% and 57%, respectively), while one in five Black and Latino adults do. It was noted that current school-age children have multiple needs that affect their educational achievement. Echoing comments shared in focus groups and interviews, data from Boston Public Schools show that over three-quarters of students are deemed high needs (76%), defined as either being low income, economically disadvantaged, being a current or former English Language Learner, or having a disability.

“Real wages have been going down for low income people [for decades]. This is at the heart of all of it: people have no time because they are working four jobs to get the same salary they used to get from one [job]. If you can’t rest, how can you be healthy? ... Some people have to work 70 hours to make ends meet.” — Key informant interviewee

Employment and Workforce

Employment can confer income, benefits, and economic stability – factors that promote health. Boston, like much of the rest of the nation, has experienced an economic upturn in recent years. In 2018, Boston’s unemployment rate was 3.0%, according to the Bureau of Labor Statistics; however, when examining unemployment data over the past several years, which can be analyzed by neighborhood and other subgroups, data show that, compared to Boston overall, unemployment rates have been significantly higher in Roxbury, Dorchester, Fenway, and Mattapan, primarily communities of color that experience disproportionate economic challenges. Boston’s largest employers are in the health care and education sectors; these sectors have experienced substantial employment gains over the past 15 years, while manufacturing and utilities have experienced substantial decreases. Focus group participants discussed the challenges of securing a job including the importance and barrier of meeting education requirements/credentials for a new job, job application processes moving online, limited technology skills, and having a criminal record.

Income and Financial Security

Income is a powerful social determinant of health that influences where people live and their ability to access resources which affects health and well-being. Across all indicators of income and financial security, there are substantial differences across Boston neighborhoods and racial and ethnic groups. The median household income in Boston is \$62,021 but ranges from \$27,964 in Dorchester to \$170,152 in South Boston. In four communities—Dorchester, Fenway, Roxbury and the South End—approximately 25%-37% of residents live below the federal poverty level.

Percent Boston CHNA Survey Respondents Reporting Having Trouble with Finances, by Type of Finances, 2019

DATA SOURCE: Boston CHNA Community Survey, 2019

NOTES: Percentage calculations do not include respondents who selected “don’t know/prefer not to answer”

Median household income is highest for White residents (\$98,317) and lowest for Latino residents (\$36,998); median value of total assets and net wealth for White residents far exceeds that for any other racial/ethnic group. Poverty and economic instability were key themes in focus groups and interviews, with participants sharing the challenges of meeting basic needs and the negative effects this has on personal health. As shown in the graph on the right, CHNA survey results indicate that a substantial number of respondents face challenges saving money, paying their mortgages, utility, credit card and medical bills, buying groceries and paying for childcare. These challenges are experienced by a higher proportion of non-White respondents and those without a college degree.

Food Insecurity

Food insecurity is directly linked to financial insecurity. Being able to afford food for their family was a concern shared by many CHNA participants. According to the BBRFSS, the proportion of Boston adults experiencing food insecurity has declined from 2010 to 2017 (25% compared to 17%); however, food insecurity experiences varied across sub-groups, with Latino (39%), Black (35%), and foreign-born (26-27%) residents being more likely to experience food insecurity.

“I’m working three jobs and I can barely afford food; I buy whatever I need to feed my kid and that’s it.” — Focus group participant

Social and Physical Environment

What is the community context for Boston residents?

Boston has several strengths it can leverage to address community health, including proximity to and abundance of health care services, diversity and multiculturalism, a strong network of collaborative social service organizations, and engaged and connected residents. However, Boston's expensive housing market is placing an economic burden on residents; housing development and the resulting gentrification is changing the social and physical environment – including access to green space and community cohesion – which is disparately affecting seniors, non-English speakers, and residents of certain neighborhoods.

Housing

Where people live is integral to their daily lives, health, and well-being. The high and rising cost of housing in Boston was a main theme that emerged in focus group and interview discussions; these perceptions are mirrored in the statistics: from 2011 to 2016, median single-family house prices increased by 48% in Boston overall, according to the U.S. Census American Community Survey.

Percent Housing Units Where 30% or More of Income Spent on Monthly Housing Costs by Housing Tenure, by Boston and Race/Ethnicity, 2017

DATA SOURCE: U.S. Census, American Community Survey 1-Year Estimates, 2017

NOTE: Asterisk (*) denotes race/ethnicity estimate was significantly different compared to the Boston estimate ($p < 0.05$)

Focus group and interview participants reported that housing costs comprise a large and ever-increasing portion of household budgets, leaving few resources for other needs such as health care, medicine, or nutritious food. The majority of housing units across Boston are renter-occupied (65%), and renter households spend an average of \$1,445 per month on housing. More than half of those in renter-occupied units are housing cost-burdened, meaning they spend more than 30% of their income on housing. A significantly higher proportion of households in East Boston (59%), Fenway (59%), Roslindale (62%), and South Boston (60%) are cost-burdened than those in other neighborhoods; additionally, as shown in the graph, Black home owner (48%) and renter households (59%) are significantly more likely to spend 30% or more of their income on housing, compared to Boston owner (32%) and renter households (51%)

overall. Additional pressures include gentrification, long wait lists for housing assistance, overcrowding, poor housing quality, and for some, housing discrimination.

In 2018, there were an estimated 6,188 residents counted as experiencing homelessness in Boston, according to the U.S. Department of Housing and Urban Development, Continuums of Care Report. Nearly one-third of homeless households included at least one child. Key informants in the field noted that those with mental illness or substance use, LGBTQ youth and seniors, immigrants, those with criminal records, single mothers, and residents who have experienced trauma as being especially vulnerable to becoming homeless.

Transportation

Transportation connects people with and between where they live, learn, play, and work. Though many focus group participants perceived improvements in transportation in recent years, others expressed concerns about cost, timeliness, and accessibility of public transportation, especially for the elderly, those with limited English proficiency, and residents of neighborhoods with limited access to transportation. According to the American Community Survey, slightly over one-third of Boston residents use a personal vehicle to get to work (39%), and another one-third use public transportation (34%). On average, Bostonians spend about 11% of household income on transportation-related expenses, according to the Bureau of Labor Statistics. Focus group participants cited challenges with public transit and transportation programs – including reliability, navigating the system, overcrowding, and the need to schedule in advance – making it difficult to keep appointments.

“Most [residents] rely on public transportation, and it is difficult when the signs are not in their language. They may not understand announcements about delays or emergencies, and it makes them feel insecure about how to navigate.” — Key informant interviewee

Green Space and the Built Environment

Slightly over 8% of land in Boston is comprised of parks, playgrounds, and athletic fields and about 7% is parkways, reservations, and beaches. While Boston is considered a very walkable city by national standards, focus group members and interviewees shared that the built environment varies across neighborhoods. Those from Allston/Brighton, Chinatown, and Dorchester perceived insufficient green space across their neighborhoods, which they attributed to the growth in new housing developments.

Social Environment

Focus group and interview participants identified examples of strong social networks in Boston, citing cohesion across different immigrant groups and among others who share similar racial, cultural, linguistic and religious backgrounds. Two-thirds of CHNA community survey respondents believed that people in their neighborhoods help each other and three-quarters perceived that they and their neighbors want the same thing for their neighborhoods. Survey respondents also indicated strong civic engagement, as evidenced by high levels of self-reported involvement in community organizations and voting. At the same time, focus group participants also mentioned a decline in community social ties, brought on by lack of time and generational differences; gentrification has likewise changed the “feel” of some neighborhoods, specifically Roxbury, East Boston, and Dorchester. CHNA community survey results and conversations in

focus groups indicate that subtle and overt discrimination is an issue in Boston, particularly for immigrants and non-English speakers, LGBTQ residents, and older residents and youth, substance users, and the homeless.

“Regardless of the changing face of the community, there is still a real sense of community here. People looking out for each other... and the amount of services and variety of services is incredible. We hope to keep that richness within the community.”
— Focus group participant

Community Assets

Understanding the resources and services available in a community—as well as their distribution—helps to elucidate the assets that can be drawn upon to address community health, as well as any gaps that might exist. Boston has numerous strengths according to focus group participants, interviewees, and CHNA community survey respondents. Neighborhoods were described as being “tight-knit” with substantial cultural diversity and strong faith communities. Sixty-eight percent of community survey respondents identified racial and cultural diversity as a top strength of their community. Activism and resiliency are other notable characteristics of Bostonians. Proximity and abundance of health care was also a key strength. Across the city, there are 22 hospitals and 33 health center access sites. Community survey respondents identified proximity to medical services as the top strength of their communities, with 69% of respondents identifying this a top strength. Other assets include services and supports for students at Boston Public Schools, and positive strides in the city for LGBTQ residents, including within the school system through Gay Straight Alliances. Finally, the social services network in Boston was perceived to be large, strong, and collaborative, although some suggested more could be done to enhance cooperation across institutions and reduce duplication.

Community Health Issues

What is the health status of Boston residents?

Health-related concerns that were identified as most pressing among CHNA participants were housing, substance use and mental health, community violence, the environment (including air quality and effects of climate change), and chronic conditions and their related risk factors such as obesity. The disparities seen in these issues mirror the historical patterns of structural, economic, and racial inequities experienced for generations across the city and the U.S.

Community Perceptions of Health

Percent Boston CHNA Survey Respondents Reporting Top Most Important Concerns in Their Community or Neighborhood That Affect Their Community's Health (N=2,053), 2019

DATA SOURCE: Boston CHNA Community Survey, 2019

NOTE: The figure above only presents the concerns that over 20% of survey respondents selected

Understanding residents' perceptions of health is a critical step in the CHNA process, providing insights into lived experiences, including key health concerns and facilitators and barriers to addressing health conditions. As seen in the graph on the right, the top community health concerns among Boston CHNA survey respondents were housing quality or affordability (51%) and alcohol/drug abuse (49%), followed by mental health (42%) and community violence (31%); these were also top concerns by neighborhood, race/ethnicity, age group, gender, and sexual orientation, with the addition of chronic diseases and related behaviors as well as the environment.

However, there were some notable differences in responses by race/ethnicity and age. Asian respondents were more likely to identify smoking (37%) and elder/aging health issues (32%), Black respondents were more likely to identify diabetes (35%), Latino respondents were more likely to identify obesity (37%), and White respondents were more likely to identify the environmental health issues (e.g., air quality, traffic, climate change) (39%) as one of their top five community health concerns.

Overall Morbidity and Mortality

Cancer (all types combined) and heart disease are the leading causes of death in Boston. For cancer, Black (175.3 deaths per 100,000 residents) and White residents (173.1 deaths per 100,000 residents) experience higher rates of death compared to Latino (109.4 deaths per 100,000 residents) and Asian residents (127.0 deaths per 100,000 residents). Similar racial/ethnic patterns are seen with heart disease mortality. Accidents are the third leading cause of death among all racial/ethnic groups - except for Asian residents, where the third leading cause of death was cerebrovascular disease (i.e., stroke). In 2016, unintentional opioid overdoses accounted for 69% of all accidental deaths. Since 2011, the death rate due to accidents has nearly doubled from 28.9 deaths to 54.6 deaths per 100,000 residents in 2016.

Cancer, accidents, and heart disease are also the leading causes of premature mortality (death before age 65); notably, accidents have surpassed heart disease as the second leading cause of premature death.

Leading Causes of Mortality in Boston, by Race/Ethnicity, Age-Adjusted Rate per 100,000 Residents, 2014–2016 Combined

Rank as Cause of Mortality	Population			
	Asian	Black	Latino	White
1	Cancer (127.0)	Cancer (175.3)	Cancer (109.4)	Cancer (173.1)
2	Heart Disease (64.6)	Heart Disease (133.9)	Heart Disease (87.8)	Heart Disease (149.3)
3	Cerebrovascular Diseases (21.5)	Accidents (38.3)	Accidents (41.6)	Accidents (56.5)
4	Alzheimer's Disease (18.1)	Cerebrovascular Diseases (39.9)	Diabetes (25.1)	Chronic Lower Respiratory Diseases (32.7)
5	Hypertension/ Renal Disease (16.1)	Diabetes (38.6)	Cerebrovascular Diseases (20.2)	Cerebrovascular Diseases (26.6)

DATA SOURCE: Massachusetts Department of Public Health, Massachusetts Death Files, 2014–2016 Combined
 DATA ANALYSIS: Boston Public Health Commission, Research and Evaluation Office

Obesity, Nutrition, and Physical Activity

Obesity is the second leading cause of preventable death in the United States and increases the likelihood of chronic conditions among adults and children. Concerns related to obesity were frequently discussed among focus group and interview participants. More than half of Boston adults (57%) and one-third of Boston Public high school students (33%) reported being overweight or obese; Black and Latino adults (68% for both groups) and high school students (36% and 37%, respectively) were more likely to be overweight or obese than White adults (51%) or students (23%). The prevalence of obesity and overweight also follows a socioeconomic gradient; residents who are renters, have lower levels of education, and lower income were more likely to be obese or overweight compared to their counterparts.

As shown below, at the neighborhood level, the percent of adults in Mattapan, Hyde Park, Dorchester, West Roxbury, East Boston, and Roslindale who were obese or overweight was significantly higher than the prevalence of obesity for the rest of Boston.

Percent Adults Reporting Obesity or Overweight, by Boston and Neighborhood, 2013, 2015, and 2017 Combined

DATA SOURCE: Boston Public Health Commission, Boston Behavioral Risk Factor Surveillance System, 2013, 2015, and 2017 combined

DATA ANALYSIS: Boston Public Health Commission, Research and Evaluation Office

NOTE: Asterisk (*) denotes where neighborhood estimate was significantly different compared to the rest of Boston ($p < 0.05$); Error bars show 95% confidence interval

Focus group and interview participants described healthy eating and physical activity as ways to prevent obesity but cited challenges affording and accessing healthy food and recreational opportunities in their community due to their income and limited community resources.

Chronic Disease

Although chronic diseases are among the most common and costly health problems, they are also among the most preventable through changes in behavior such as reduced use of tobacco and alcohol and improved diet and physical activity. In 2013-2017, one-quarter (25%) of Boston adults reported being diagnosed with hypertension, one of the most significant risk factors for heart disease and stroke. However, among focus group and interview participants, diabetes was frequently mentioned as a community concern that impacts both adults and children, followed by pediatric asthma. While there is a low prevalence of diabetes and asthma in Boston (9% and 11% respectively), there were significant differences across the population. Black and Latino residents have a higher prevalence of diabetes and experience higher diabetes-related hospitalization and death rates than White residents.

Similar to diabetes, there were disparities in the distribution of asthma across the population, including by race/ethnicity, socioeconomic status, and neighborhood. Black and Latino adults and children experience significantly higher asthma-related emergency department visits compared to White adults and children, as seen below in the graph of pediatric asthma emergency department visits. Participants shared that young children living in poverty are disproportionately affected by pediatric asthma as a result of poor environmental factors and/or poor living conditions including exposure to air pollutants, rodents, mold, and tobacco smoke. Also disproportionately affected by diabetes and asthma are residents of Roxbury and Dorchester, who experience diagnoses and hospitalizations at significantly higher rates than residents in the rest of Boston.

Pediatric Asthma Emergency Department Visit Rate, by Boston and Race/Ethnicity by Age, Age-Specific Rate per 10,000 Residents, 2016–2017 Combined

DATA SOURCE: Massachusetts Center for Health Information and Analysis, Acute Hospital Case Mix Databases, 2016–2017 Combined

DATA ANALYSIS: Boston Public Health Commission, Research and Evaluation Office

NOTES: Sample sizes for Asian in the 0–2 years, 6–12 years, and 13–17 years are ≤ 20 and rates should be interpreted with caution; Bars with pattern indicate reference group within each age category; Asterisk (*) denotes where estimate was significantly different compared to reference group within each specific age category (p < 0.05)

Mental Health

Mental and physical health are intricately connected, and mental illness is among one of the leading causes of disability in the United States. Mental health issues were described as a priority concern across almost all focus group and interviews, and often discussed in connection with trauma. Stress, anxiety, and depression were the most frequently-cited challenges among Boston residents, especially those who identify as LGBTQ, low-income residents, seniors, children, immigrants, and communities of color.

Percent Boston Public High School Students Reporting Persistent Sadness, by Boston and Selected Indicators, 2013, 2015, and 2017 Combined

DATA SOURCE: Centers for Disease Control and Prevention and Boston Public Schools, Youth Risk Behavior Survey, 2013, 2015, and 2017 combined

DATA ANALYSIS: Boston Public Health Commission, Research and Evaluation Office

NOTE: Students were asked in the past 12 months if they felt sad or hopeless every day for 2 weeks or more; Bars with pattern indicate reference group for its specific category; Asterisk (*) denotes where estimate was significantly different compared to reference group within specific category (p < 0.05); Error bars show 95% confidence interval

Surveillance and survey data indicate that anxiety and depression are somewhat common across Boston residents, with one in eight Boston adults reporting persistent sadness (12%) and one in five reporting that they felt persistent anxiety (21%).

Furthermore, the proportion reporting persistent anxiety has increased over time; a higher proportion of females (24%), lower income individuals (28%), younger (24%), LGBTQ (33%), and unemployed residents (33%) reported persistent anxiety than their counterparts.

Concern for mental health issues among children and youth was also a prominent theme in focus groups and interviews and this is validated through quantitative data: as shown on the right, about one-third of Boston public high school students reported feeling persistent sadness; the rate is even significantly higher among female students and students who identify as LGBTQ. While statistics indicate that the proportion of people receiving treatment for depression has grown, barriers such as stigma, cultural and linguistic differences, and lack of sufficient providers constrain access to services for many. Access to mental health services, especially to providers that understand different cultures and languages, was cited as a challenge by several interviewee and focus group participants.

Substance Use

Substance use was considered a priority health issue in many focus group and interview discussions. Participants mentioned a variety of substances including marijuana, prescription drug use, and opioids as being among the most concerning. Co-occurring mental health and substance use issues were frequently discussed among key informants, as well as the interrelationship between trauma, mental health, and substance use. Smoking among adults and youth, as well as e-cigarette and marijuana use among youth, have significantly decreased in Boston; however, there are significant differences by population groups. Notably, LGBTQ adults and youth are more likely to use tobacco (22% and 12%, respectively), e-cigarettes (18% of LGBTQ youth), and marijuana (34% and 39%, respectively), compared to heterosexual/non-transgender adults and youth.

Approximately one-quarter of Boston adults reported engaging in binge drinking behavior, although LGBTQ adults were significantly more likely than heterosexual/non-transgender adults (24.0%) and males (29.8%) were significantly more likely than females (19.8%) to report this. For alcohol-related hospitalizations, White residents had the highest rates of hospital patient encounters for alcohol poisoning, while Black residents had the highest rates of hospital patient encounters for alcohol dependence/abuse.

The rate of opioid overdose deaths in Boston has significantly increased since 2013 and was highest among Latino residents (50.5 deaths per 100,000 residents), followed by White residents (45.1 deaths per 100,000 residents) in 2016.

Unintentional Opioid Overdose Mortality Rate, by Boston and Race/Ethnicity, Age-Adjusted Rate per 100,000 Residents 12 Years and Over, 2013–2016

DATA SOURCE: Massachusetts Department of Public Health, Boston resident deaths, 2013–2016

DATA ANALYSIS: Boston Public Health Commission, Research and Evaluation Office

NOTES: Sample size for Black and Latino for 2013 and 2014 are ≤ 20 and rates should be interpreted with caution; Data not shown for Asian due to insufficient sample size; Dashed line indicates reference group for statistical testing done for 2016 data; Asterisk (*) denotes where estimate was significantly different compared to reference group for 2016 data ($p < 0.05$); Change over time was statistically significant for Boston (increase over time), Latino (increase over time), and White (increase over time)

The majority of focus group participants and key informants who discussed substance use as a concern identified opioids as a persistent issue in Boston. They noted that there were several barriers to treatment and recovery services, including cost, availability of different options, and limited cultural and language competencies of providers to treat immigrant communities.

Violence and Trauma

Violence and trauma are important public health issues affecting physical and mental health and were frequent concerns reported by focus group and interview participants. Many focus group participants expressed concern about personal safety in their communities, noting that they saw communities of color and children as being disproportionately affected.

Percent Boston CHNA Survey Respondents Reporting Considering Their Neighborhood Unsafe or Extremely Unsafe, by All Respondents and Selected Indicators, 2019 (n=1,920)

DATA SOURCE: Boston CHNA Community Survey, 2019

NOTE: Chi-square analyses were conducted and there were statistically significant differences within the following groups ($p < 0.05$): race/ethnicity, age, gender identity, educational attainment, and parent status

Similarly, one quarter of respondents to the CHNA community survey described their neighborhoods as unsafe or extremely unsafe; Black and Latino respondents were more likely than other respondents to describe their communities this way (40% and 37%, respectively). Intimate partner violence was also mentioned in focus groups and interviews, with women of color and non-English speaking immigrants identified as particularly vulnerable populations. Populations varied on their experience of violence overall. According to the BBRFSS, respondents who identified as female, 35-49 years of age, 50-65 years of age, residents of the Boston Housing Authority, renters or tenants receiving housing assistance, and LGBTQ-identified respondents were significantly more likely than their counterparts to report experiencing violence in their lifetime.

Exposure of children and youth to unhealthy relationships and violence (adverse childhood experiences) is also of concern: nearly one in five Boston adults (19%) reported experiencing at least one adverse childhood experience such as living with a caregiver with mental health concerns or who was a problem drinker, having parents who were physical violent towards each other, or living with a caregiver who had been in prison. Focus group and interview participants noted that trauma from community violence, poverty, and, more recently, fear of deportation and family separation, are growing issues of concern.

Maternal and Child Health

Quantitative data indicate that the overall birth rate in Boston has significantly declined for women 15-44 years old since 2011 to 41.6 births per 1,000 female residents in 2017. However, current birth rates are significantly different by neighborhood compared to the rest of Boston; female residents in Hyde Park, Charlestown, Roslindale, Mattapan, East Boston, Dorchester, and West Roxbury had significantly higher birth rates. Rates of infants with low birthweight and preterm births—both important risk factors for infants—are less than 10% and have generally remained steady from 2011 to 2017; however, rates for both are significantly higher among Black (13% and 12%, respectively) and Latino mothers (9% and 11%, respectively). Access to prenatal care has improved over time, and currently more than eight in ten mothers in Boston receive adequate or adequate plus prenatal care (83%). However, Asian, Black, and Latino mothers are significantly less likely than White mothers to receive adequate or adequate plus prenatal care (84%, 76%, 79%, and 89% respectively). CHNA participants tended to discuss maternal and child health in the context of economics and parenting concerns. Childcare was frequently discussed, with expensive or inconvenient childcare, long waitlists, and lack of summer childcare as primary issues. Difficulty paying for childcare was also an issue for respondents to the Boston CHNA community survey (11% of survey respondents reporting having trouble paying for childcare).

“People are always working and giving all of their money to child care. I’m working my life away to pay someone else to take care of my children.” — Focus group participant

Sexual Health

Sexually transmitted infections (STIs) remain a public health problem in the United States, despite the fact that they are preventable. While sexual health was not a prominent theme discussed across focus groups or interviews; the Youth Risk Behavioral Survey provides helpful insights into sexual behaviors among youth, such as condom use, to inform STI prevention strategies. This is particularly important given that young adults experienced the highest rates of chlamydia (1,737.8 cases per 100,000 residents). Boston has experienced a significant increase in cases of chlamydia and gonorrhea over time with disparities by neighborhood, age, and sex. While the incidence of HIV among Boston residents has decreased over time, disparities persist by neighborhood, race/ethnicity, age, and sex.

Environmental Health

A healthy environment is important for a high quality of life and good health. Boston CHNA survey respondents cited their top environmental health concerns as: outdoor noise pollution from vehicles, outdoor air pollution from vehicles, and dangerous traffic. Overall, these top three concerns were similar across neighborhoods, except for East Boston which cited airport noise as a top concern. Air pollution and quality was a concern discussed in focus groups in Chinatown and East Boston where residents perceived that lower-income neighborhoods were more vulnerable to pollutants and litter due to proximity to highways, airports, and train stations. BBRFSS data show secondhand smoke exposure was significantly higher among Boston residents of color and lower socioeconomic status.

Multiple key informants explained how more extreme weather, heat, and rising seas from climate change are increasing health problems, particularly for mental health, respiratory, cardiovascular and vector-borne disease. Boston emergency department utilization rates and costs for climate-driven health issues are expected to rise in the future. Community health and resilience efforts can reduce such threats and costs, and help the city prepare for Climate Ready Boston's estimate that 7% of our land will experience frequent storm water flooding by 2050.

Health Care Access and Utilization

Access to comprehensive, quality health care services is important for promoting and maintaining health, preventing and managing disease, and reducing the chance of premature death. Boston is a city with many health care resources and a high proportion of residents have health insurance. Focus group participants, interviewees, and Boston CHNA survey respondents all indicated satisfaction with health care in their community. Residents most commonly obtain health care from a private doctor's office or a public health clinic/community health center, and BBRFSS results show that approximately eight in ten respondents have at least one person as their personal doctor.

Percent Boston CHNA Survey Respondents Reporting Factors That Made It Harder for Them to Get Health Care Services They Needed in Past Two Years (N=1,014), 2019

DATA SOURCE: Boston CHNA Community Survey, 2019

NOTE: Data arranged in descending order; Percentage calculations do not include respondents who selected "prefer not to answer/don't know" or "none of the above;" Respondents were allowed to select multiple response options; therefore, percentages may not sum to 100%

According to focus group members, interviewees, and community survey respondents, several barriers to accessing health care in Boston exist. The most common barriers mentioned by interviewees and focus group participants included underinsurance; language and immigration status; navigation and care coordination challenges; transportation; and lack of culturally-

sensitive approaches to care. As seen in the graph, for CHNA community survey respondents, long wait times for appointments and lack of evening or weekend services were the top two factors that made it difficult for them to access health care (44% and 38% of survey respondents, respectively). Cost of care, especially dental care, was also cited as a challenge for some Boston residents.

Community's Vision and Opportunities

Participants in interview and focus group discussions were asked for their suggestions for addressing identified needs and their vision for the future. Suggestions included the following:

- **Employment and Workforce-** Reduce employment barriers by addressing minimum education requirements to be more inclusive of those with valuable lived experience; subsidizing the cost of childcare so low-income parents can work towards upward mobility through education and job training; and increasing youth employment opportunities.
- **Education-** Focus resources on early childhood education; increase social supports in public schools; train educators on trauma-informed approaches to recognize trauma symptoms and respond accordingly; use restorative justice approaches to discipline and behavior issues; and address chronic absenteeism by bolstering wrap around services.
- **Food Insecurity-** Increase opportunities to access healthy and affordable food through: urban farming and community gardens; farmer's markets that accept SNAP benefits; and strengthening initiatives that address food access from a clinical perspective, where practitioners can prescribe services and are reimbursed as part of Accountable Care Organizations.
- **Housing-** Mitigate the negative impacts of gentrification and displacement by creating more opportunities for home ownership in non-White communities to build generational wealth; and pushing for long-term renewable leases for nonprofits and social services agencies that are being strained by rising operating costs. Further leverage the partnerships between housing and health care for more place-based services.
- **Transportation-** Focus on transportation equity in lower income communities that tend to have longer commuting times; reduce traffic by investing in speedy bus lanes; continue making the city more bikeable; and explore fee structures for ride share programs to generate revenue for operational costs at the local level.
- **Chronic Disease-** Focus on prevention strategies and chronic disease management—particularly to prevent diabetes and obesity; and increase more affordable gym and healthy food options.
- **Mental Health-** Invest in more mental health supports in public schools; reduce cultural stigma around mental health services, and recruit clinicians who reflect the diversity of Boston.
- **Substance Use-** Focus on prevention efforts, especially related to marijuana use and prescription drug use among adolescents.
- **Violence and Trauma-** Restore trust among government, police, and health care institutions by strengthening community linkages and improving community cohesion.
- **Maternal and Child Health-** Provide more supports to learn positive parenting skills; and subsidize the cost of childcare for low-income families, especially for single-headed households.

- **Environmental Health-** Address environmental health concerns in a systemic way and in partnership across sectors and disciplines, especially as new developments increase across the city; and invest in a centralized data repository to track environmental health data.
- **Health Care Access-** Increase supports for navigating the complex health system and delivering culturally-sensitive care and linguistically appropriate services to diverse groups.
 - ▶ Greater collaboration and information or data sharing to better serve patients and clients, especially related to the roll out of Accountable Care Organizations (ACOs).
 - ▶ Pursuing multi-year funding that allow organizations to respond to crisis and opportunities, and to build internal and external capacity.

Key Themes and Conclusions

Overarching themes that emerged from this synthesis that cut across multiple topic areas include the following:

- **Health disparities across most issues show similar patterns by racial/ethnic group and socioeconomic status, and mirror the historical inequities brought about by generations of institutional racism, structural barriers, and discriminatory policies.** Whether differences in cancer mortality or asthma prevalence – or unemployment rates and housing instability – similar patterns can be seen in the data, with communities of color, immigrant communities, lower income individuals, and residents of low resourced neighborhoods, among others, experiencing a disproportionate burden across nearly all areas. Although current data sources are not currently designed to be able to examine intersecting identities more deeply, this disproportionate burden is likely even worse when considering intersectionality—that is, the complex, cumulative way in which the effects of multiple forms of discrimination (such as racism, sexism, and classism) combine, overlap, or intersect, especially in the experiences of marginalized groups. These issues are dynamically intertwined and reflect the cumulative and current challenges residents face resulting from historical and structural inequities across multiple systems.
- **With a current population of nearly 670,000 residents, Boston has experienced—and is expected to continue to experience—population growth across every neighborhood in the city, though growth rates across neighborhoods vary.** Overall, Boston is a young city, with about one-third of residents under the age of 25, that continues to experience population growth. The greatest increases in population have occurred in Roxbury, South Boston, Hyde Park, East Boston, and Charlestown.
- **Boston is a richly diverse city in terms of racial, ethnic, and linguistic population groups, though data show this diversity is not similar across neighborhoods.** Boston's large immigrant and non-English speaking communities were identified as facing unique challenges related to social and economic factors as well as navigating the health care system. The wide-ranging diversity of Boston residents presents challenges when delivering health and social services that aim to meet the multitude of needs across the city. Additionally, CHNA community survey results and conversations in focus groups indicated that subtle and overt discrimination is an issue in Boston, particularly for immigrants and non-English speakers, LGBTQ residents, youth and older residents, substance users and the homeless.
- **Although unemployment rates are low and there is economic opportunity for many residents across the city, there are substantial differences in financial security across neighborhoods and racial and ethnic groups.** The median household income in Boston is

\$62,021 but ranges from \$27,964 in Dorchester to \$170,152 in South Boston. In four communities—Dorchester, Fenway, Roxbury, and the South End— approximately 25-37% of residents live below the federal poverty level. Focus group and interview participants discussed the role poverty plays in exacerbating health challenges, particularly among vulnerable groups. Quantitative data show that risk-related behaviors and health outcomes generally continue to have inverse relationships with socioeconomic factors.

- **Housing affordability and its implications emerged as a key theme that arose across secondary data, the community survey, and focus groups and interviews.** Of all social determinants identified as imperative to health and well-being, housing stability emerged as a top priority among participants. More than half of those in renter-occupied units across the city are housing cost-burdened, meaning they spend more than 30% of their income on housing. Residents frequently discussed issues of gentrification, long wait lists for Section 8 housing, housing discrimination, overcrowding, and poor housing quality as consequences of a tight and expensive housing market.
- **The impact of chronic diseases and their risk factors—especially diabetes, obesity, and pediatric asthma—emerged as a priority concern among residents.** Residents of color, as well as residents who live in Roxbury and Dorchester are disproportionately affected by chronic diseases. Assessment participants frequently discussed a number of social determinants that presented challenges to the prevention and management of these chronic conditions. In addition to poverty and high housing costs that force individuals to prioritize their spending, a lack of affordable recreational programming and access to nutritious food were described as barriers to health and well-being. Lower income neighborhoods were described as having fewer affordable gyms, grocery stores, and fast food and convenience stores compared to affluent areas.
- **Behavioral health, specifically mental health and substance use among young people are growing concerns among community residents; opioids, prescription medication, and marijuana use were reported as most concerning.** Co-occurring mental health and substance use issues were frequently discussed, as well as the interrelationship between trauma, mental health, and substance use. Quantitative data show that one in five Boston residents report persistent anxiety and this proportion has increased over time. The rate of opioid overdose deaths in Boston has also significantly increased, particularly among Latinos. Specific population groups are disparately affected by mental health and substance use, especially residents who are younger, LGBTQ, lower income, and of communities of color.
- **Violence-based trauma was identified as a major factor of negative community health outcomes, and there is a need for more trauma-informed approaches to care, particularly for children and communities of color.** One in four Boston CHNA community survey respondents described their neighborhoods as unsafe or extremely unsafe, with Black and Latino respondents more likely to describe their communities this way. Apart from community violence and intimate partner violence, assessment participants identified poverty, and more recently, the fear of deportation and family separation, as a growing issue. Exposure of children and youth to unhealthy relationships and violence (adverse childhood experiences) is also of concern: nearly one in five Boston adults reported experiencing one adverse experience over their lifetime.
- **Environmental health risk factors are a particular concern in relation to air quality, effects of climate change, and the built environment.** Poor environmental health quality has the greatest impact on low-income communities. Issues such as noise and air pollution

and dangerous traffic were prominent concerns among survey respondents. Indoor air quality is also an issue, and more than one in ten Boston adults on the BBRFSS reported exposure to secondhand smoke, with Asian, Black, and Latino residents all significantly more likely than White residents to report exposure. The effects of climate change were also noted, with flooding being one of the most significant issues. Boston emergency department utilization rates and costs for climate-driven health issues are expected to rise in the future. Climate change projections estimate that 7% of Boston's land area could be exposed to frequent stormwater flooding by 2050.

- **Boston has many health care and social service assets that can be leveraged, but access to those services is a challenge for some residents.** Proximity of health care services and education institutions, diversity and multiculturalism, and engaged residents were noted as key strengths among Bostonians that can be leveraged in future planning. Barriers to care were multifaceted and included underinsurance, language and immigration status, navigation and care coordination challenges, transportation, and lack of culturally-sensitive approaches to care.
- **Strengthening partnerships and infrastructure for collaborative data gathering and sharing can facilitate greater coordination and identify specific population groups most in need.** Undertaking this collaborative CHNA demonstrated that organizations can leverage their strengths and resources for collaborative assessment and planning. However, as extensive as the data gathering was for this effort, it also identified current limitations. Large datasets are not necessarily available on some population groups such as residents who speak specific languages or on particular topics such as child health ages 0-14 years old. As the Collaborative engages in further planning, there is opportunity ahead to strengthen the relationships, practices, and infrastructure to address these data limitations. In the future, potentially more granular analyses by neighborhood, topic, or population group can be conducted to help tailor strategies for action.

Priorities for Collaborative Action

During May-June 2019, an engagement process was undertaken through an online survey, small group discussions with residents and organizational staff across the city, and a large inclusive prioritization meeting to identify the priorities for collaborative action. The final priorities selected were:

- **Housing** (including affordability, quality, homelessness, ownership, gentrification, and displacement)
- **Financial Security and Mobility** (including jobs, employment, income, education, and workforce training)
- **Behavioral Health** (including mental health and substance use)
- **Accessing Services** (including health care, childcare and social services)

The cross-cutting and overarching focus of the planning process will be around **Achieving Racial and Ethnic Health Equity** recognizing that institutional racism and structural inequities are what drive the health disparities we see around race, ethnicity, and language in the city for nearly all issues.

From June-September 2019, the Boston CHNA-CHIP Collaborative, in conjunction with key stakeholders and community residents, will develop a community health improvement plan that

outlines next steps to address the prioritized health needs from the CHNA. The CHIP development process will commence with a full-day planning session in late June 2019 to develop the initial output for the goals, objectives, and strategies within each priority area. Further refinement and development of the CHIP will occur during the summer 2019, with a final CHIP report and Year 1 Action Planning to be completed by September 2019.

2019 COMMUNITY HEALTH NEEDS ASSESSMENT

Background

Overview of Boston CHNA-CHIP Collaborative

The Boston CHNA-CHIP Collaborative is a new initiative created by a number of stakeholders—community organizations, health centers, community development corporations, hospitals, and the Boston Public Health Commission. It aims to undertake the first large-scale collaborative city-wide Community Health Needs Assessment (CHNA) and Community Health Improvement Planning (CHIP) process. While community health assessment and planning have been long-standing endeavors among individual organizations across the city, the Boston CHNA-CHIP Collaborative intends to leverage, align, and coordinate efforts and resources across multi-sector stakeholders in Boston.

Learn more about the Collaborative at <http://www.bostonchna.org/>

Prior to launching the first joint community health needs assessment and planning process, the Collaborative undertook an eight-month planning process to define its scope (mission, vision, values, etc.), identify needs for stakeholder representation to outreach to other collaborative partners, define roles and relationships among collaborative partners, establish a recommended governance structure, design an organizational structure, and outline a budget and member contributions.

The Collaborative's **vision** is a *healthy Boston with strong communities, connected residents and organizations, coordinated initiatives, and where every individual has an equitable opportunity to live a healthy life*. Our **mission** is to achieve sustainable positive change in the health of Boston by collaborating with communities, sharing knowledge, aligning resources, and addressing root causes of health inequities. The Collaborative's **goals** are to achieve this mission by engaging with the community to:

- Conduct a joint, participatory community health needs assessment (CHNA) for Boston every three years discussing the social, economic, and health needs and assets in the community.
- Develop a collaborative community health improvement plan (CHIP) for Boston to address issues identified as top priority and identify opportunities for shared investment.

- Implement efforts together where aligned and track individual organizational activities related to those aligned efforts.
- Monitor and evaluate CHIP strategies for progress and impact to continuously inform implementation.
- Communicate about the process and results to organizational leadership, stakeholders, and the public throughout the assessment, planning, and implementation time period.

The work of the Collaborative is guided by the following **shared values**:

Equity

Focus on inequities that affect health with an emphasis on race and ethnicity

Inclusion

Engage diverse communities and respect diverse viewpoints

Data driven

Be systematic in our process and employ evidence-informed strategies to maximize impact

Innovative

Implement approaches that embrace continuous improvement, creativity, and change

Integrity

Carry out our work with transparency, responsibility, and accountability

Partnership

Build trusting and collaborative relationships between communities and organizations to foster sustainable, community-centered change

What is a Community Health Needs Assessment and Community Health Improvement Plan?

This report presents findings from the joint Community Health Needs Assessment (CHNA), which was conducted September 2018–June 2019, and will inform discussions and priority areas for the upcoming CHIP. Figure 1 provides an overview of the CHNA-CHIP process.

A CHNA identifies health-related needs, strengths, and resources of a community through systematic, comprehensive data collection and analysis. A Community Health Improvement Plan (CHIP) is the response to needs identified in the CHNA. The CHIP process involves creating a detailed, evidence-based improvement plan to address the prioritized needs of the community. The Boston CHIP, to be completed by September 2019, will be a three-year plan to identify strategies for action, leverage shared resources, and support policy change to improve the health of Boston residents, especially those most in need.

Figure 1. Community Health Needs Assessment and Community Health Improvement Plan Process

SOURCE: Association for Community Health Improvement, 2017. Community Health Assessment Toolkit. Accessed at www.healthycommunities.org/assesstoolkit

Purpose and Scope of the 2019 Community Health Needs Assessment

In 2018-2019, the Boston CHNA-CHIP Collaborative undertook a city-wide Community Health Needs Assessment to:

- Systematically identify the health-related needs, strengths, and resources of a community to inform future planning,
- Understand the current health status of Boston overall and its sub-populations within their social context, and
- Meet regulatory requirements for a number of institutions, organizations, and agencies (e.g., IRS requirements for non-profit hospitals, PHAB for health departments).

Definition of Community Served

The 2019 Boston CHNA focused on the geographic area of the City of Boston (Figure 2). While Boston is a city of neighborhoods, CHNA data are presented for Boston overall and by different sub-populations where appropriate and available. This includes by neighborhood but also by race/ethnicity, gender, LGBTQ status, income, and other defining characteristics.

Figure 2. Map of Boston Neighborhoods

The map above delineates the neighborhood boundaries used in this report. Neighborhoods can be identified in several ways. In this report, consistent with the *Health of Boston 2016-2017*, zip codes are used to identify neighborhood boundaries since this information is collected with health data, and it allows us to standardize data to rates using population estimates which can change over time.

The zip codes used in this report for identifying neighborhoods are those currently used by the United States Postal Service (USPS). USPS zip codes are not based on geography, demographics, or population size; they are collections of mail delivery routes that are defined at the convenience of the U.S. Postal Service and may change from time to time. Data from the U.S.

Census Bureau comes in the form of Zip Code Tabulation Areas (ZCTAs), generalized areal representations of USPS zip code service areas. ZCTA is a trademark of the U.S. Census Bureau whereas ZIP Code is a trademark of the U.S. Postal Service.

With this approach, some neighborhoods are combined to provide a larger area for analysis. Please note that the zip code neighborhood definitions used in this report may differ from those used by other organizations and agencies.

METHODS

The following section details how data for the CHNA were compiled and analyzed, as well as the broader lens used to guide this process.

Social Determinants of Health Framework

Upstream Approaches to Health

Having a healthy population is about more than delivering quality health care to residents. Where a person lives, learns, works, and plays all have an enormous impact on health. Health is not only affected by people's genes and lifestyle behaviors, but by upstream factors such as employment status, quality of housing stock, and economic policies. Figure 3 provides a visual representation of these relationships, demonstrating how individual lifestyle factors, which are closest to health outcomes, are influenced by more upstream factors such as employment status and educational opportunities.

Figure 3. Social Determinants of Health Framework

SOURCE: World Health Organization, Commission on the Social Determinants of Health, Towards a Conceptual Framework for Analysis and Action on the Social Determinants of Health, 2005.

The data to which we have access is often a snapshot in time, but the people represented by that data have lived their lives in ways that are constrained and enabled by economic circumstances, social context, and government policies. To this end, much of this report is dedicated to discussing the social, economic, and community context in which Boston residents live. Throughout the report, there are descriptions at the beginning of each section discussing why these issues are important and how they affect health (entitled “Why is This Important?”). As such, we hope to understand the current health status of Boston residents and the multitude of factors that influence health to enable the identification of priorities for community health planning, existing strengths and assets upon which to build, and areas for further collaboration and coordination.

Health Equity Lens

When compared to many cities across the country, Boston is a healthy city, with numerous successes to celebrate. However, this is not uniformly the case for all neighborhoods or population groups in Boston, and specific groups consistently experience poor health outcomes. Barriers to the opportunities to live a healthy life may be disproportionately concentrated among certain populations, such as communities of color, low-income populations, homeless persons, persons with disabilities, and the lesbian, gay, bisexual, transgender, and queer (LGBTQ) community.

The influences of race, ethnicity, income, and geography on health patterns are often intertwined. In the United States, social, economic, and political processes ascribe social status based on race and ethnicity, which may influence opportunities for educational and occupational advancement and housing options, two factors that profoundly affect health. Institutional racism, economic inequality, discriminatory policies, and historical oppression of specific groups are a few of the factors that drive health inequities in the U.S.

In the present report, we describe health patterns for Boston overall and areas of need for particular population groups. Understanding factors that contribute to health patterns for these populations can facilitate the identification of data-informed and evidence-based strategies to provide all residents with the opportunity to live a healthy life.

Approach and Community Engagement Process

Collaborative and Work Group Structure

The CHNA aimed to engage agencies, organizations, and residents in Boston through different avenues. As described below, the Collaborative's structure provided the guiding decision-making framework for this work.

Steering Committee

Comprises of 19 members representing hospitals, health centers, Boston Public Health Commission, a public health organization focused on community, community development corporations, and community representatives. Its role is to provide strategic direction and oversight of the process (See [APPENDIX A](#) for list of Steering Committee members).

Operations Committee

Comprises of Steering Committee co-chairs and the Collaborative's Coordinator. This Committee resolves operational issues requiring immediate actions.

Work groups

Comprises of general membership. The two Work Groups for the CHNA were open to anyone who was interested in being involved. They provided input and assistance on implementing activities. For the Boston CHNA, these two Work Groups were:

Secondary Data Work Group

Secondary Data Work Group – included 32 members representing a range of organizations, including hospitals, health centers, local public health, and community-based organizations, among others. The Work Group's charge is to provide guidance on secondary data approach and indicators and foster connections with key networks and groups to provide relevant data (See [APPENDIX B](#) for list of members).

Community Engagement Work Group

included 54 members representing a range of organizations, including hospitals, health centers, local public health, education, community development, social services, and community-based organizations, among others. The Work Group's charge is to provide guidance on the approach to community engagement, input on primary data collections methods, and support with logistics for primary data collection (See [APPENDIX B](#) for list of members).

General Membership

Attends events, shares information, and participates in work groups.

The Collaborative hired Health Resources in Action (HRiA), a non-profit public health organization, as a consultant partner to provide strategic guidance and facilitation of the process, collect and analyze data, and develop the report deliverables.

Work Groups, Engagement, and Outreach

As noted, two work groups—the Community Engagement Work Group and Secondary Data Work Group—provided input and support throughout the CHNA process. The Community Engagement group identified the goals of the community engagement process as 1) to ensure that diverse community voices are represented throughout the CHNA-CHIP process; and 2) to involve community members and stakeholders in the development and implementation of the CHNA-CHIP process to achieve shared ownership of the process and product.

During the CHNA process, the **Community Engagement Work Group** was instrumental in developing the goals and methods for the primary data and the community engagement approach for the CHNA, identifying topics to explore for data collection and population groups that were highest priority, reaching out to community groups and residents for engagement, providing feedback on the survey instrument and focus group and interview guides, and pilot-testing the survey instrument. Members met seven times in a series of virtual and in-person meetings over eight months and were also engaged by email and telephone between meetings to provide feedback throughout the process.

In addition to providing guidance and input on methods, members played an integral role in data collection efforts. Work group members volunteered to conduct interviews, recruit for focus groups, facilitate focus groups, promote surveys through social media and their networks, and administer surveys to respondents. As part of this effort, orientation sessions were offered to work group member volunteers to provide an overview of data collection protocols, including logistics, roles, and best practices.

The **Secondary Data Work Group** members identified the goals of the secondary data as: 1) to examine inequities by population group: by race/ethnicity, gender, age, sexual orientation, socioeconomic status (SES), etc.; 2) to provide a baseline for community health level data to track over time; and 3) to present trends to identify emerging issues or whether there have been changes over time for issues of concern. The Secondary Data Work group approach to the secondary data focused on diving deep into topic areas identified from previous assessments and frame the discussion around the social determinants of health.

The Secondary Data Work Group was instrumental in developing and providing feedback on list of data indicators, identifying potential data sources, and making connections to those sources. Members met six times in a series of virtual and in-person meetings over eight months and were also engaged by email and telephone between meetings to provide feedback throughout the process. The Secondary Data Work Group and Community Engagement Work Group met collaboratively in October 2018 to ensure alignment across methods, and again in late April 2019 for a large-group synthesis of preliminary data. This April 2019 three-hour “Data Day” meeting provided an opportunity to reflect on preliminary data by topic area and collaboratively interpret preliminary data in the form of data placements to inform the draft CHNA report.

Methods: Review of Existing Secondary Data

Secondary data are data that have already been collected for another purpose. Examining secondary data helps us to understand trends, provide a baseline, and identify differences by sub-groups. It also helps in guiding where primary data collection can dive deeper or fill in gaps. While the secondary data for this CHNA cover a wide range of issues, there is a particular focus to dive more deeply into areas already identified in previous assessments (e.g., housing, transportation, income, employment, education, mental health, substance, chronic conditions and their risk factors, violence and trauma, and access to services) as well as frame the discussion comprehensively around the social determinants of health.

Data Sources

Secondary data for this CHNA were from a variety of sources, including the Boston Behavioral Risk Factor Surveillance Survey (BBRFSS), Youth Risk Behavior Survey (YRBS), U.S. Census American Community Survey (ACS), vital records, Acute Hospital Case Mix Database from the Center for Health Information and Analysis, and a number of other agencies and organizations. Please see Appendix C for more technical notes about the most frequently common datasets cited in this report.

Analyses

All secondary data on birth and death records, BBRFSS, YRBS, and Acute Hospital Case Mix were analyzed by the Research and Evaluation Office of the Boston Public Health Commission. Other data were analyzed by the organizations cited in the data source. Analyses are presented as frequencies (percentages) and rates throughout the report. Data from the ACS and surveillance systems, such as the BBRFSS and YRBS, are presented with confidence intervals (or error bars in the figures), where possible. When statistical significance testing was conducted, it is noted in figures or in text. Specifically, when the word “significantly” is used in the text it

connotes statistical significance ($p < 0.05$). Additional information on confidence intervals and significance testing can be found in the Reporting Notes in this section.

Limitations

Each data source for the secondary data has its own set of limitations. Overall, for the data in this report it should be noted that different data sources use different ways of measuring similar variables (e.g., different questions to identify race/ethnicity; different boundaries for neighborhoods). There may be a time lag for many data sources from the time of data collection to data availability. Some data are not available by specific population groups or at a more granular geographic level due to small sub-sample sizes. In some cases, data from multiple years may have been aggregated to allow for data estimates at a more granular level or among specific groups.

It should also be noted that for the datasets used, it is not always possible to examine data in a more granular way. For example, data are examined by race/ethnicity and by neighborhood, but the sample sizes are not large enough to look at data by race/ethnicity within neighborhood in many cases. Additionally, while data are examined by major categories of races and ethnicities (e.g., White, Black, Latino, Asian), it is not possible for many of these data sources to examine data of sub-population groups within these categories (e.g., Chinese descent, Vietnamese descent). Please contact the Boston Public Health Commission Research and Evaluation Office for further consideration of custom health data analysis of specific Boston resident sub-population groups.

Methods: Primary Data Collection

Primary data are new data collected specifically for the purpose of the CHNA. Goals of the Boston CHNA primary data were: 1) to delve deeply into people's perceptions, lived experiences, challenges, and facilitators around certain issues; and 2) to fill in gaps on specific topic areas or population groups where limited data were available. Primary data were collected using three different methods for the Boston CHNA: a community survey, focus groups, and key informant interviews.

Boston CHNA Community Survey

A community survey was developed and administered over six weeks in February-March 2019. The survey focused on a range of issues related to the social determinants of health, community perceptions, and access to care and was developed with extensive input from the Community Engagement Work Group and guided by existing validated questions from the field or used in other studies. The survey was pilot-tested in late January 2019, and the final instrument was launched in February 1, 2019 with wider dissemination starting the following week. The survey was administered on-line and via hard copy in seven languages (English, Spanish, Portuguese, Haitian Creole, Chinese, Vietnamese, and Arabic). Extensive outreach was conducted by Collaborative members to disseminate the survey via social media, institutional e-newsletters, e-mails to large networks, waiting rooms, 13 Boston Public Library neighborhood branches, community events, and large apartment buildings. Over 35 organizations assisted with survey dissemination (See [APPENDIX D](#) for list of organizations). Additionally, Healthy Community Champions (an initiative of grassroots ambassadors) conducted targeted survey administration in specific neighborhoods.

The final sample of the CHNA Community Survey comprises 2,404 respondents who were Boston residents. Table 1 provides the breakdown of those respondents by self-identified neighborhood of residence and compares the percent distribution of that neighborhood in Boston.

Table 1. Boston CHNA Survey Respondents Distribution by Neighborhood Compared to % of Population in Boston

Neighborhood	# of Survey Respondents (N=2,404)	% of Survey Respondents	% of Population in Boston†
Allston/Brighton	243	10.1%	9.5%
Back Bay	36	1.5%	8.4%
Beacon Hill	24	1.0%	*
Charlestown	93	3.9%	2.8%
Chinatown	71	3.0%	*
Dorchester	535	22.3%	21.6%
Downtown	15	0.6%	*
East Boston	199	8.3%	7.0%
Fenway	80	3.3%	8.2%
Hyde Park	101	4.2%	5.0%
Jamaica Plain	203	8.4%	5.9%
Mattapan	102	4.2%	4.4%
Mission Hill	18	0.8%	*
North End	10	0.4%	*
Roslindale	157	6.5%	4.9%
Roxbury	185	7.7%	6.6%
South Boston	85	3.5%	6.0%
South End	120	5.0%	5.2%
West End	30	1.3%	*
West Roxbury	97	4.0%	4.3%

†DATA SOURCE: U.S. Census, American Community Survey, 5-Year Estimates, 2013-2017

*NOTE: For ACS data, neighborhoods were defined by Boston Public Health Commission using ZCTAs; Back Bay includes Back Bay, Beacon Hill, Downtown, North End, and West End; South End includes South End and Chinatown; Roxbury includes Roxbury and Mission Hill

Additional data on survey respondent characteristics such as age, education, primary language, gender identity, and other demographic characteristics can be found in [APPENDIX E](#).

Analyses

Frequencies were calculated for each survey question. Not all respondents answered every question; therefore, denominators in analyses reflect the number of total responses for each question and varied by question. Additionally, denominators excluded respondents who selected “prefer not to answer/don’t know.” For questions that allowed for multiple responses

(i.e., questions that asked respondents to check all that apply), the denominator was out of the total number of respondents who selected at least one response option for the question. Stratified analyses were conducted for select questions by specific sub-groups that had large enough sample sizes. Responses by neighborhood are presented for neighborhoods that had 100 or more respondents to the survey. Chinatown respondents (n=71) were also included in neighborhood-level analyses because secondary data combine Chinatown and South End together in analyses, and thus neighborhood-specific data for Chinatown are not found elsewhere. Sub-group analyses by primary language spoken are also presented in the report; these sub-groups represent respondents who either completed the survey in the specific language or indicated on the survey that it was a primary language that they spoke at home.

Limitations

While strong efforts were made to conduct outreach across the City with a deeper dive within neighborhoods and population groups who experience disproportionate health burden, the community survey used a convenience sample. Because a convenience sample is a type of non-probability sampling, there is potential selection bias in who participated or was asked to participate in the survey. Due to this, results cannot necessarily be generalized to the larger population. Additionally, some sub-group analyses consist of very small sub-sample sizes, these sub-group analyses are still presented in the report for population groups where data are limited from other sources (e.g., Haitian Creole speakers, non-binary and transgender individuals, etc.); however, given the small sub-sample sizes and convenience sampling methodology, results should be interpreted with caution.

Focus Groups and Key Informant Interviews

Focus Groups

Thirteen focus groups were conducted with specific populations of interest: 12 focus groups conducted specifically for the collaborative CHNA and one additional focus group conducted by work group members who submitted notes for the CHNA. Focus groups were 90-minute semi-structured conversations with approximately 8-12 participants per group and aimed to delve deeply into community's needs, strengths, and opportunities for the future. Focus groups were conducted with the following population groups, including residents of specific neighborhoods:

- Female low-wage workers (e.g. housekeepers, child care workers, hotel service workers, etc.)
- Male low-wage workers (e.g. janitorial staff, construction, etc.)
- Seniors (ages 65+) with complex, challenging issues (e.g. homebound, medical complications)
- Residents who are housing insecure (no permanent address or close to eviction)
- Latino residents in East Boston (in Spanish)
- LGBTQ youth and young adults at risk of being homeless
- Immigrant parents of school age children (5-18 years)
- Survivors of violence; mothers who have been impacted by violence
- Parents who live in public housing in Dorchester
- Chinese residents living in Chinatown (in Chinese)
- Haitian residents living in Mattapan (in Haitian Creole)
- Residents in active substance use recovery
- Additional focus group with notes provided: Chinese residents living in Chinatown

A total of 104 community residents participated in focus groups, representing 13 neighborhoods across the city. Nearly half of focus group participants identified as Black or African American (45%), a third of participants identified as Hispanic or Latino (34%), and 10% identified as White. The majority of participants identified as female (57%), 36% identified as male, and 7% identified as transgender or genderqueer. Additional data on focus group participant characteristics can be found in Appendix F. Fifteen community and social service organizations located throughout Boston assisted with recruiting participants and/or hosting focus groups (See [APPENDIX G](#) for list of organizations).

Key Informant Interviews

A total of 45 key informant interviews were completed, six of which were additional interviews submitted by work group volunteers. Interviews were 45-60-minute semi-structured discussions that engaged institutional, organizational, and community leaders and front-line staff across sectors. Discussions explored interviewees' experiences of addressing community needs and opportunities for future alignment, coordination, and expansion of services, initiatives, and policies. Sectors represented in these interviews included: public health, health care, housing and homelessness, transportation, community development, faith, education, public safety, environmental justice, government, workforce development, social services, food insecurity, business organizational staff that work with specific population such as youth, seniors, disabled, LGBTQ, and immigrants. See [APPENDIX H](#) for a list of key informant interviewees.

Analyses

The collected qualitative information was coded using NVivo qualitative data analysis software and then analyzed thematically by data analysts for main categories and sub-themes. Analysts identified key themes that emerged across all groups and interviews as well as the unique issues that were noted for specific populations. Throughout the qualitative findings included in this report, the term “participants” is used to refer to focus group and key informant interview participants. Unique issues that emerged among a group of participants are specified as such (e.g., Spanish-speaking focus group participants, etc.). Frequency and intensity of discussions on a specific topic were key indicators used for extracting main themes. While neighborhood differences are noted where appropriate, analyses emphasized findings common across Boston. Selected paraphrased quotes—without personal identifying information—are presented in the narrative of this report to further illustrate points within topic areas.

Limitations

There were multiple moderators for the focus groups—particularly for non-English language groups—and interviews were conducted by both HRiA and work group members. Therefore, there is likely variation in how interview and focus group protocols were interpreted and implemented. Focus groups also ranged in size and varied in group dynamics. Additionally, while focus groups and interviews provide valuable insights and important in-depth context, due to their small sample size and non-random sampling methods, results are not necessarily generalizable.

Reporting Notes

Confidence Intervals

For Boston Behavioral Risk Factor Surveillance Survey data, which represents a sample of residents, many graphs provide 95% confidence intervals to give a sense of how accurate the result is considered as a measurement for the entire population (i.e., how much sampling error exists for a given percentage or point estimate). Smaller confidence intervals indicate less sampling error and greater data precision than larger confidence intervals. Error bars are used in the graphs to show the confidence intervals, indicating the range in which we believe the true value of the population lies.

Testing for Significant Difference

Tests for statistical significance were conducted to compare different data points by sub-groups or over time. The tests for statistical significance were conducted either against a reference group (e.g., Asian, Latino, and Black residents compared to White residents), against the Boston average or for a neighborhood against the rest of Boston (Boston overall minus the population of that specific neighborhood), comparing the difference in distribution of responses to question categories among sup-populations, or examining differences in time points. If there is a statistically significant difference between groups or data points, where the $p < 0.05$, then this indicates that there is less than a 5% chance that there is no difference between the data points, providing stronger evidence that any differences we see are not just due to chance.

In this report, tests for significance are noted in the table or graph notes, while the narrative uses the words “significant” or “significantly” to note where there are statistically significant differences when testing has been completed.

Terminology

Numerous terms are used throughout the report for different population groups. For race/ethnicity, the terms White, Black, Latino, and Asian are used for brevity in graphs and narrative. Since Latino is considered an ethnicity, when the terms White, Black, and Asian are used, this indicates residents identifying as White, Black, or Asian who do not also identify as Latino. For the terms used for different racial/ethnic groups, Asian refers to individuals in the data that, if asked for more specific designations, self-identified as Asian Indian, Cambodian, Chinese, Filipino, Japanese, Korean, Vietnamese or of other Asian descent. Black refers to individuals in the data that self-identified as African American, Barbadian, Cape Verdean, Ethiopian, Haitian, Jamaican, Nigerian, Somali, or other sub-Saharan African descent. Latino refers to individuals in the data that self-identified as Mexican or Mexican American, Salvadoran, Puerto Rican, Dominican, Cuban, Colombian, Guatemalan, Honduran, or other Central or South American descent. White refers to individuals in the data that self-identified as European, Middle Eastern, or North African descent.

The term LGBTQ is used in the report to refer to individuals that self-identified as lesbian, gay, bisexual, transgender, or queer.

POPULATION CHARACTERISTICS – WHO LIVES IN BOSTON?

Population Overview

Why is This Important?

The population profile of a community, including density, patterns of growth and age distribution, are important factors that inform our understanding of a community's health and health care needs. A neighborhood in which many aging baby boomers reside, for example, will have different health challenges and needs than one populated predominantly by college students or young families.

Key Findings in This Section

With a current population of nearly 670,000 residents, Boston has experienced—and is expected to continue to experience—population growth. Growth rates across neighborhoods vary. Roxbury, South Boston, Hyde Park, East Boston, and Charlestown, for example, have all experienced double digit increases in population over the past five years, while Fenway and the South End have seen far more modest growth. Overall, the city is a young one, with about one-third of residents under age 24. There is substantial variation in age profiles across neighborhoods however: Dorchester, Hyde Park, Mattapan, and Roslindale have the highest proportion of residents under age 18, while Back Bay and West Roxbury have the highest proportion over age 65.

Population Count and Characteristics

The most current figures from the 2013-2017 American Community Survey show that Boston has 669,158 residents (Table 2), a population that has grown 8% in the last several years. According to the Boston Planning and Development Agency (BPDA), Boston's population is projected to continually grow at that rate—to 723,500 people by 2030.¹ In the last several years, the population of the city has increased in all neighborhoods. While the population increase citywide has been about 8%, population increases in Roxbury, South Boston, Hyde Park East Boston, and Charlestown were more than double digits, ranging from almost 11%-17%, from 2008-2012 to 2013-2017.

Table 2. Total Population, by Boston and Neighborhood, 2008-2012 and 2013-2017

	2008-2012	2013-2017	% population change 2012 to 2017
Boston	619,662	669,158	8.0%
Allston/Brighton	61,159	63,270	3.5%
Back Bay	51,735	55,635	7.5%
Charlestown	17,052	18,901	10.8%

	2008-2012	2013-2017	% population change 2012 to 2017
Dorchester (02121, 02125)	58,797	63,733	8.4%
Dorchester (02122, 02124)	75,304	79,717	5.9%
East Boston	41,680	46,655	11.9%
Fenway	52,897	54,267	2.6%
Hyde Park	29,219	33,084	13.2%
Jamaica Plain	36,866	39,435	7.0%
Mattapan	27,335	29,141	6.6%
Roslindale	30,370	32,819	8.1%
Roxbury	37,454	43,871	17.1%
South Boston	34,452	39,866	15.7%
South End	34,395	34,777	1.1%
West Roxbury	27,163	28,505	4.9%

DATA SOURCE: U.S. Census, American Community Survey 5-Year Estimates, 2008-2012 and 2013-2017

NOTE: Neighborhoods as defined by Boston Public Health Commission; Back Bay includes Back Bay, Beacon Hill, Downtown, North End, and West End; South End includes South End and Chinatown; Boston population count includes some areas that are not covered by neighborhood definitions per ZCTAs

Boston's population represents a range of age groups, but the distribution of these ages varies across neighborhoods. Hyde Park, Dorchester, East Boston, Mattapan, Roslindale, and West Roxbury have the largest population proportions (over 20%) of children under 18 years old (Figure 4). Fenway has a smaller percentage of children, but nearly six in ten of its population is 18-24 years old. West Roxbury is the neighborhood with largest distribution of older residents 65+ years old at 18.7%. (See [APPENDIX I](#) for further granular breakdowns of the under 18 year old and 65+ year old categories within each neighborhood.)

Figure 4. Age Distribution, by Boston and Neighborhood, 2013–2017

DATA SOURCE: U.S. Census, American Community Survey 5-Year Estimates, 2013–2017

NOTE: Neighborhoods as defined by Boston Public Health Commission; Back Bay includes Back Bay, Beacon Hill, Downtown, North End, and West End; South End includes South End and Chinatown

Racial, Ethnic, Cultural, and Language Diversity

Why is This Important?

The United States is becoming increasingly diverse racially and ethnically. The nation is projected to become a “minority-majority” society by 2043, one in which White (non-Latino) residents will be the largest racial and ethnic group, but will constitute less than half of the population.² At the same time, disparities in health and health care access across different racial and ethnic groups are persistent challenges. People of color experience poorer health outcomes and greater barriers to accessing health care compared to whites and have lower utilization of health care resources.³ Understanding the racial, ethnic, cultural and language profiles of Boston residents helps to provide context to data about health status and the structural, discriminatory, and social factors that contribute to health inequities.

Key Findings in This Section

Boston is a diverse city with 23% of residents identifying as Black, nearly 20% identifying as Latino, and nearly 10% identifying as Asian. Boston has a large immigrant community, with most immigrants in the city having been born in the Caribbean or Asia. One-third of residents speak a language other than English at home, the most prevalent language being Spanish. Diversity among younger residents is greater than among older residents, and at the neighborhood level, diversity varies substantially. Black residents comprise a larger portion of the population in Roxbury, Hyde Park, and Dorchester and Mattapan, while Latino residents comprise over half the population of East Boston; the South End, Fenway, and Allston/Brighton have the highest proportion of Asian residents in the city. Between 2012 and 2017, Latino residents experienced the largest population growth of all racial and ethnic groups.

Boston Language Diversity

Nearly 4 in 10 Boston residents speak a language other than English at home.

Racial and Ethnic Composition

Focus group and interview participants engaged in the assessment described their communities as richly diverse, mentioning wide racial, cultural, and linguistic diversity. As one key informant interviewee noted, *“Multiculturalism is one of Boston’s strengths; it facilitates connections and bridges gaps in an organic way.”* Focus group participants, particularly those from non-English groups—identified diversity as a strength of their communities, but also noted that new communities faced barriers with social and economic factors as well as navigating the health care system. These themes are discussed at greater length in other sections of this report.

Multiculturalism is one of Boston’s strengths; it facilitates connections and bridges gaps in an organic way. — From a key informant interviewee

Data show that Boston is a diverse city, but population composition by race and ethnicity varies by neighborhoods (Table 3). While more than one in five Boston residents (22.7%) identify as Black, in neighborhoods such as Roxbury, Hyde Park, and Dorchester the percentage is 40-50%, while Black residents comprise 77.2% of the population of Mattapan. Nearly 20% of the Boston population identifies as Latino, yet 57.4% of East Boston’s population and 27.3% of Roxbury’s population is Latino. Additionally, while Boston’s overall population increased by 8% in the last several years, Latino residents experienced a growth of 20.1% (See [APPENDIX I](#) for data over time). Asian residents are nearly 10% of Boston’s population, but 23% of the population in the South End (which also includes Chinatown here), and approximately 18% of both Fenway and Allston/Brighton’s populations.

Table 3. Racial and Ethnic Distribution, by Boston and Neighborhood, 2013–2017

	Asian	Black	Latino	White	Other
Boston	9.4%	22.7%	19.4%	44.9%	3.6%
Allston/Brighton	17.7%	4.9%	11.7%	61.7%	8.6%
Back Bay	10.6%	4.1%	6.8%	76.1%	2.4%
Charlestown	7.2%	5.8%	11.8%	73.2%	2.0%
Dorchester (02121, 02125)	6.7%	44.8%	24.6%	17.5%	6.5%
Dorchester (02122, 02124)	9.9%	49.0%	14.8%	21.6%	4.7%
East Boston	3.8%	2.6%	57.4%	32.6%	3.7%
Fenway	18.3%	5.6%	12.9%	60.0%	3.2%
Hyde Park	2.1%	42.2%	27.1%	25.1%	3.4%
Jamaica Plain	6.7%	10.6%	21.8%	56.8%	4.0%
Mattapan	NA	77.2%	15.0%	4.2%	2.8%
Roslindale	2.2%	21.4%	24.5%	48.9%	3.0%
Roxbury	8.3%	40.8%	27.3%	20.0%	3.7%
South Boston	4.8%	5.9%	10.2%	77.5%	1.6%
South End	23.0%	11.7%	16.6%	45.8%	2.8%
West Roxbury	6.7%	5.6%	7.9%	77.8%	2.0%

DATA SOURCE: U.S. Census, American Community Survey 5-Year Estimates, 2013–2017

NOTE: Neighborhoods as defined by Boston Public Health Commission; Back Bay includes Back Bay, Beacon Hill, Downtown, North End, and West End; South End includes South End and Chinatown; Latino includes residents who identify as Latino regardless of race and racial categories include residents who do not identify as Latino; Other includes American Indian and Alaska Native, Native Hawaiian and Other Pacific Islander, Some other race, and Two or more races; NA denotes where data not presented due to insufficient sample size

The Boston Public School (BPS) system is even more diverse than the city overall. Of the 52,665 students in BPS in 2018, nearly 42% identify as Latino and 32% as Black. Table 4 presents student enrollment data for BPS by race/ethnicity over time. Trend data provided [APPENDIX I](#) indicate that distribution by race/ethnicity has been similar since 2014.

Table 4. Number of Boston Public School Enrolled Students and Percent, by Race/Ethnicity, 2014–2018

	2014	2015	2016	2017	2018
Total	54,300	54,312	53,530	53,263	52,665
Asian	8.6%	8.5%	8.7%	8.8%	9.0%
Black	34.5%	33.6%	32.4%	31.8%	31.5%
Latino	40.4%	40.9%	41.5%	41.8%	41.9%
White	13.6%	13.8%	14.2%	14.2%	14.2%
Other	11.5%	11.7%	11.9%	12.2%	12.4%

DATA SOURCE: Massachusetts Department of Elementary and Secondary Education, School and District Profiles, Trends - DART, 2014–2018

NOTE: Other includes Native American, Native Hawaiian or Pacific Islander, and Multi-race

Language Diversity

Boston is a city of many languages. Nearly 38% of residents speak a language other than English at home (Figure 5), and those figures are significantly higher for East Boston, Dorchester (zip codes 02121, 02125), Roxbury, Hyde Park, and the South End (which includes Chinatown) compared to Boston overall. Given this diversity, many indicators from the Boston CHNA survey are provided later in this report by primary language spoken. Boston's language diversity was considered a major strength of the city, according to focus group participants, especially those who were non-English speakers. Several participants discussed belonging to "tight-knit" cultural groups where residents could speak freely in their native language. For example, one focus group participant from Chinatown shared, "There are many Chinese speaking residents [in Chinatown], and it's easy for someone who mainly speaks Chinese to live here." Similarly, in East Boston, one participant expressed, "There are a lot of Latinos that speak Spanish here and I'm grateful that they can help me navigate services." Non-English focus group participants reported that for the most part, they were able to access some community resources in their native language; however, they also reported experiencing much longer wait times for these services. One resident explained, "I do not speak English, so I [usually] wait 1-2 hours for any social services."

Figure 5. Percent Population 5 Years and Over Who Speak a Language Other Than English, by Boston and Neighborhood, 2013-2017

DATA SOURCE: U.S. Census, American Community Survey 5-Year Estimates, 2013-2017

NOTE: Neighborhoods as defined by Boston Public Health Commission; Back Bay includes Back Bay, Beacon Hill, Downtown, North End, and West End; South End includes South End and Chinatown; Asterisk (*) denotes where the neighborhood estimate is significantly different compared to the Boston estimate ($p < 0.05$); Error bars show 95% confidence interval

Spanish, French/Haitian Creole/Cajun, other Indo-European languages (e.g., Portuguese, Italian), and Chinese are the most commonly spoken languages in Boston other than English. Table 5 indicates which languages are most common in specific neighborhoods among non-English speakers. [APPENDIX I](#) provides additional data on languages spoken in Boston.

Table 5. Most Common Language Other Than English Spoken and Percent Population 5 Years and Over Who Speak the Language, by Neighborhood, 2013–2017

	Most Common Language Spoken	Percent
Allston/Brighton	Chinese (inclu. Mandarin, Cantonese)	9.3%
Back Bay	Chinese (inclu. Mandarin, Cantonese)	5.8%
Charlestown	Spanish	10.2%
Dorchester (02121, 02125)	Spanish	21.6%
Dorchester (02122, 02124)	Spanish	12.5%
East Boston	Spanish	55.2%
Fenway	Spanish	10.4%
Hyde Park	Spanish	22.6%
Jamaica Plain	Spanish	18.8%
Mattapan	French, Haitian Creole, or Cajun	18.2%
Roslindale	Spanish	21.5%
Roxbury	Spanish	25.3%
South Boston	Spanish	8.9%
South End	Chinese (inclu. Mandarin, Cantonese)	16.5%
West Roxbury	Spanish	5.4%

DATA SOURCE: U.S. Census, American Community Survey 5-Year Estimates, 2013–2017

NOTE: Neighborhoods as defined by Boston Public Health Commission; Back Bay includes Back Bay, Beacon Hill, Downtown, North End, and West End; South End includes South End and Chinatown

APPENDIX I includes additional data on the linguistic diversity of Boston Public School students.

Immigration

Key informant interviewees and focus group participants described a robust immigrant community in Boston. Shared cultural beliefs and values such as hard work and devotion to one's family were described as strengths of these communities by participants. For example, immigrant residents from Mattapan shared, "*Haitians work hard and are very active; our community gives a great contribution in the work force and professional. They move the economy forward and are trust worthy.*" Interviewees noted that immigrants also face substantial challenges in accessing various systems in the U.S. due to language and cultural differences. Health care and social service providers shared that the diversity of immigrant and refugee groups in the community creates challenges for services to reach everyone effectively.

Further, several focus group participants also noted that the city is home to a number of undocumented residents; undocumented residents were described as facing substantial barriers to accessing health and other services, and were particularly vulnerable in the current political

climate. One key informant shared, “*With immigration policy, [residents] worry that applying for government benefits will impact their legal status. Some people are not willing to apply anymore.*” One focus group participant who identified as undocumented described obstacles in almost every facet of her life, sharing, “*People like me can’t get things like cable or anything that gives you a better quality of life because I don’t have a social security. If you don’t have a social security, you can’t access anything; I don’t even trust banks, so I don’t have any accounts.*”

As focus group and interview participants noted, Boston’s immigrant community is strong. While over 28% of Boston residents were born outside the United States, that figure is significantly higher in neighborhoods such as East Boston, Dorchester, and Mattapan (Figure 6). Those born outside the United States were most likely to come from the Caribbean (29.1% of foreign-born residents) and Asia (26.0% of foreign-born residents) (See [APPENDIX I](#) for additional data).

Figure 6. Percent Foreign Born Population, by Boston and Neighborhood, 2013–2017

DATA SOURCE: U.S. Census, American Community Survey 5-Year Estimates, 2013–2017

NOTE: Neighborhoods as defined by Boston Public Health Commission; Back Bay includes Back Bay, Beacon Hill, Downtown, North End, and West End; South End includes South End and Chinatown; Asterisk denotes where the neighborhood estimate is significantly different compared to the Boston estimate ($p < 0.05$); Error bars show 95% confidence interval

Immigration and citizenship status have been themes both in the national policy dialogue and in focus group discussions with immigrant communities in Boston. Data indicate that 14.5% of Boston residents are naturalized residents, while 9.0% are documented foreign-born residents and 5.5% are undocumented foreign-born residents (See [APPENDIX I](#)). In qualitative discussions, participants mentioned the need for outreach and services to undocumented residents. The Mayor’s Office for Immigrant Advancement (MOIA) provides pro-bono immigration advice clinics to residents of Boston. Between 2015 and 2017, there were a total of 1,356 clinics held, with about 19 attendees per clinic. Of these clinics, nearly half of the cases (48%) have focused on family-based immigration issues, by the far the biggest focus area of the clinics (See [APPENDIX I](#)).

Education

Why is This Important?

Education affects health in multiple ways. Individuals of lower educational attainment generally have less favorable health profiles compared to their counterparts with greater educational attainment.⁴ Most directly, education increases economic and social resources.⁵ Those with higher levels of education are less likely to experience unemployment and economic hardship and have more social connections than those with lower levels. Those with lower levels of education are more likely to be engaged in jobs that are lower paying or unstable, lack employer-provided health insurance benefits, or that are more risky or unsafe. Research has also found that adults with higher educational levels have higher levels of health literacy, causing them to better comprehend medical instructions, understand medications, and advocate for themselves with health providers than their counterparts with lower educational attainment.⁶ Inequities in educational funding and unequal access to key educational resources, including skilled teachers and quality curriculum, are concentrated in low-income communities and communities of color and are interconnected with the unequitable and discriminatory housing and neighborhood policies these same communities experience.⁷

Key Findings in This Section

Education was viewed by Boston CHNA survey respondents as a key component of a healthy community. While statistics point to a well-educated community (nearly half of Boston adults have a college degree or more), there are substantial differences across racial and ethnic groups, with a high proportion of White and Asian adults with college degrees or more and far fewer Black and Latino adults. Over a quarter of Latino adults in Boston do not have a high school diploma. Echoing comments shared in focus groups and interviews, data from the Boston Public Schools show that over three-quarters of students are deemed high needs, defined as either being low income, economically disadvantaged, being a current or former English Language Learner, or having a disability. Differences in educational quality and resources across Boston neighborhoods was an issue raised by many focus group participants and interviewees, and were concerns within the same communities experiencing economic, housing, and employment challenges as well.

“When it comes to kids in elementary [school], one of the bigger challenges becomes feeling like you have to luck out to get into a good school. It’s a lottery, and if you’re able to tour and make informed choices you are not guaranteed a slot at the school. The older the children get, the more challenging it is finding quality education in the city.” — Key informant interviewee

Educational Attainment

Among residents engaged in CHNA data collection, education was an important factor to them. As discussed later in this report, when Boston CHNA Survey respondents were asked what defines a “healthy community”, education was the most fifth most cited factor in a list of 20 provided with 45% it as an important defining characteristic of their ideal healthy community. Similarly, focus group participants connected educational attainment with health outcomes in their communities and perceived that increasing opportunities for educational achievement

ultimately leads to healthier communities. A few key informants described education in Boston as a strength, mentioning a rich history of public education and increased efforts for structural commitments to support student's social-emotional needs.

Overall, Boston is a highly educated city with nearly half of adults (48.2%) ages 25 years old or older holding a college degree or more. However, there are stark differences by race/ethnicity and by neighborhood. Nearly seven in ten White residents hold a college degree, while only two in ten Black and Latino residents do (Figure 7). Nearly six in ten Asian residents hold a college degree. With 26.1%, Latino adult residents are most likely to not have a high school diploma. Only 4% of White adult residents do not hold a high school diploma, while the figure is 18% among Asian adult residents and 15% among Black residents.

By neighborhood, East Boston, Roxbury, Dorchester, and the South End have a significantly greater proportion of residents who do not have a high school diploma compared to Boston overall (Figure 8). Data on other educational attainment categories by neighborhood can be found in [APPENDIX I](#).

Figure 7. Educational Attainment for Population 25 Years and Over, by Boston and Race/Ethnicity, 2017

NOTE: Neighborhoods as defined by Boston Public Health Commission; Back Bay includes Back Bay, Beacon Hill, Downtown, North End, and West End; South End includes South End and Chinatown; Asterisk (*) denotes neighborhood estimate was significantly different compared to the Boston estimate ($p < 0.05$); Error bars show 95% confidence interval

School-Age Students

Addressing the educational needs of specific population groups was an issue discussed in several focus groups and interviews. Children with special needs, undocumented students, and those who have experienced trauma were identified as groups that needed more support in and outside of the classroom. For example, parents in Chinatown discussed challenges receiving adequate special education resources. One shared, *“My kid needs speech therapy; he’s getting one hour per week with the speech therapist and I requested increased services but was denied. I wish the school provided more resources for special education.”* When discussing strategies to address trauma, one key informant shared, *“We need early interventions that have wrap around service models; we need individual counseling, family therapy, a parent advocate...we need interventions at multiple levels.”*

As such, the student population in Boston Public Schools is diverse in their needs. Figure 9 shows that 32.1% of BPS students are considered English Language Learners, defined as a student whose first language is a language other than English and who is unable to perform ordinary classroom work in English, 20.3% are students with disabilities, and 56.5% are considered economically disadvantaged. Altogether, 76.2% of BPS students are deemed high needs, as either being low income, economically disadvantaged, being a current or former English Language Learner, or having a disability.

Figure 9. Percent Boston Public School Students Enrolled, by Selected Sub-Populations, 2019

DATA SOURCE: Massachusetts Department of Elementary and Secondary Education, School and District Profiles, Selected Populations, 2019

NOTES: Years represent school years (e.g., 2014 represents school year 2013-2014); First Language not English indicates the percent of enrollment whose first language is a language other than English; English Learners indicates the percent of enrollment who are English learners, defined as 'a student whose first language is a language other than English who is unable to perform ordinary classroom work in English'; Economically disadvantaged is determined based on a student's participation in one or more of the following state-administered programs: the Supplemental Nutrition Assistance Program (SNAP), the Transitional Assistance for Families with Dependent Children (TAFDC), the Department of Children and Families' (DCF) foster care program, and MassHealth (Medicaid); High needs is defined as students designated as either low income (prior to School Year 2015), economically disadvantaged (starting in School Year 2015), or ELL, or former ELL, or a student with disabilities

Chronic absenteeism—defined as students who are absent 10% or more of their total number of student days of membership in a school—was a concern among parents and those in the educational field. Key informant interviewees in the field discussed how chronic absenteeism is of particular concern among children from families who are homeless or with parents who have substance use disorders or co-occurring mental health issues. One interviewee shared, “Kids are missing a lot of academic time and school days because they are placed in shelters and then transported somewhere else; kids are sometimes commuting an hour and a half each way to school...” Interviewees indicated that children who have experienced trauma are more likely to miss school or become disengaged when they are in school. There were suggestions for more trainings that focus on trauma-informed approaches to teaching.

“Being trauma-informed in education means knowing what to look for [trauma symptoms] and being able to respond accordingly. Because your response as a provider or a teacher can either make or break how kids are engaged in services.” — Key informant interviewee

Figure 10 presents data from BPS on students who are chronically absent. About one-quarter (25.5%) of all BPS students from the 2017-2018 school year were identified as chronically absent. The proportion is over 30% for students who are economically disadvantaged, have a disability, or who identify as Latino or American Indian.

Figure 10. Percent Boston Public School Students Chronically Absent, 2018

DATA SOURCE: Massachusetts Department of Elementary and Secondary Education, School and District Profiles, Student Attendance, 2018
 NOTES: Years represent school years (e.g., 2014 represents school year 2013-2014); Chronically absent is defined as students who were absent 10% or more of their total number of student days of membership in a school; Economically disadvantaged is determined based on a student's participation in one or more of the following state-administered programs: the Supplemental Nutrition Assistance Program (SNAP), the Transitional Assistance for Families with Dependent Children (TAFDC), the Department of Children and Families' (DCF) foster care program, and MassHealth (Medicaid); High needs is defined as students designated as either low income (prior to School Year 2015), economically disadvantaged (starting in School Year 2015), or ELL, or former ELL, or a student with disabilities

Approximately three-quarters (76.6%) of students who started high school in 2013-2014 completed it in four years, graduating in 2018 (Figure 11). This graduation rate falls in the middle of other similarly-sized cities; 4-year graduation rates in Washington DC and San Francisco were 68.5% and 84.4%, respectively, in the same year. Figure 11 also shows the four-year graduation rates across different sub-populations of students. Data on drop-out rates among the same sub-populations can be found in [APPENDIX I](#), along with data on standardized test proficiency results by grade within BPS.

Figure 11. Graduation Rate Among Boston Public High School Students, 2018

DATA SOURCE: Massachusetts Department of Elementary and Secondary Education, School and District Profiles, Cohort 2018 Graduation Rates, 2018

NOTES: Years represent school years (e.g., 2014 represents school year 2013-2014); Graduation Rate indicates the percentage of students who graduate with a regular high school diploma within 4 years (# of students in cohort who graduate in 4 years or less); Low-income indicates the percent of enrollment who meet any one of the following definitions of Low-income: 1) the student is eligible for free or reduced price lunch; or 2) the student receives Transitional Aid to Families benefits; or 3) the student is eligible for food stamps; The English language learners, Special Education, and Low-income groups include all students who were reported in those categories at least once in high school. Students can be counted in more than one group

Educational quality was brought up among many focus group and interview participants and discussed within the frame of educational equity. Participants believed that students in lower income neighborhoods were not necessarily receiving the same quality education as those in more affluent neighborhoods within Boston. Parents in focus groups in Allston/Brighton and in Dorchester held the perception that public schools did not invest in schools equitably across neighborhoods. One Allston parent shared, *“I want better education for my daughter. The scores at our schools are very low compared to other neighborhoods.”* Some parents discussed lottery systems that made it challenging to access neighborhood schools that were perceived to be of higher caliber. One key informant explained, *“When it comes to kids in elementary [school], one of the bigger challenges becomes feeling like you have to luck out to get into a good school. It’s a lottery, and if you’re able to tour and make informed choices you are not guaranteed a slot at the school. The older the children get, the more challenging it is finding quality education in the city.”*

Key informant interviewees who work with families or who were in the educational field expressed the need for smaller class sizes, more social emotional supports, teachers that reflect the diversity of the community, and more venues to discuss health and wellness. One key informant summarized, *“We need to increase teachers and counselors and decrease class sizes. There is an opportunity to formalize more social support positions within Boston Public Schools to address [child] mental health on an on-going basis.”* In addition, several discussed the importance of early childhood education and supports. Key informants also expressed the

desire for cultural immersion experiences. One shared, “[We need to be] bringing in more opportunities for children around art and cultural experiences. Helping children think about culture inside and outside the academic lens.”

Employment and Workforce

Why is This Important?

Americans spend more than half their waking lives at work.⁸ Employment can confer income, benefits, and economic stability, among other factors that promote health. Well-paying jobs enable workers to live in healthier neighborhoods, afford nutritious food, and pay health care-related expenses.⁹ By contrast, unemployment, underemployment, and job instability not only make it more difficult to purchase goods and services that enhance health, but also have been shown to contribute to stress-related health conditions and poorer mental health.¹⁰

“I’ve struggled to get a job. I have more than a decade of experience, but the minimum requirements are always a bachelor’s degree, so that disqualifies you for ten jobs right off the bat.” — From a focus group participant

Key Findings in this Section

Boston, like much of the rest of the nation, has experienced an economic upturn in recent years. In 2018, Boston’s unemployment rate was 3.0%, according to the Bureau of Labor Statistics. However, when examining unemployment data over the past several years, which can be analyzed by neighborhood and other subgroups, data show that unemployment rates have been significantly higher in Roxbury, Dorchester, Fenway, and Mattapan compared to Boston overall. In focus groups and interviews, those with lower education or fewer skills (especially in technology), immigrants, and those with a criminal record additionally were reported to experience employment challenges. Boston’s largest employers are in the health care and education sectors; these sectors have experienced substantial employment gains over the past 15 years, while manufacturing and utilities have experienced decreases. Numerous Boston CHNA survey respondents reported feeling underemployed, wanting higher pay, or desiring greater job satisfaction. Focus group members and interviewees described challenges in getting a secure job, specifically around meeting educational credential requirements, navigating online job application systems, and dealing with CORI criminal background checks.

Employment Rate and Industry

Overall, Boston residents have been experiencing low levels of unemployment in the last several years. However, in focus group and interview discussions, there were differing views about employment and economic prospects in the city of Boston. Several key informant interviewees talked about the economic vitality in the city, citing a strong local economy and thriving small businesses. However, many residents across several focus groups discussed the challenges for workers, especially those with lower educational levels or skills, in securing well-paying jobs, remarking on the stark divides in class between Boston residents. One interviewee shared, “We have become the two cities of Boston. The extreme and stark difference is right in your face; where you have urban affluence right up against urban poverty... the Ritz condo development right next to St. Francis House...” Several focus group participants from

Dorchester, East Boston, Mattapan, Chinatown, and Allston/Brighton described working multiple low-wage jobs and the stressors that come from a lack of job security. One Dorchester resident shared, “I have three jobs and still make less than \$45,000 a year, barely getting by.” Immigrant communities, single-parent households, residents with a criminal record, and parents of children with special needs were described as especially vulnerable to unstable employment situations.

In 2018, Boston had an unemployment rate of 3.0% according to the U.S. Bureau of Labor Statistics (BLS). However, 2018 BLS data are not able to be examined by different neighborhoods or population groups. Data from the 2013-2017 aggregated American Community Survey from the U.S. Census shows that 7.3% of Boston residents were not employed over this five-year period, yet that figure was significantly higher for the neighborhoods of Roxbury, Dorchester, Fenway, and Mattapan (Figure 12). Additional unemployment data by race/ethnicity can be found in [APPENDIX I](#).

Figure 12. Percent Population 16 Years and Over Unemployed, by Boston and Neighborhood, 2013-2017

DATA SOURCE: U.S. Census, American Community Survey 5-Year Estimates, 2013-2017

NOTE: Neighborhoods as defined by Boston Public Health Commission; Back Bay includes Back Bay, Beacon Hill, Downtown, North End, and West End; South End includes South End and Chinatown; Asterisk (*) denotes neighborhood estimate was significantly different compared to the Boston estimate ($p < 0.05$); Error bars show 95% confidence interval

According to 2015 Census data analyzed by BPDA, Boston has almost 13,000 payroll jobs per square mile, a job density similar to San Francisco, New York City, and Washington, DC.¹¹ Boston's largest employers reflect the dominance of the health care and education industries, which account for 14 of the top 20 largest employers in the city. The top five largest employers in the city are Massachusetts General Hospital, Brigham and Women's Hospital, Boston Public Schools, Boston University, and Boston Children's Hospital.

This mirrors the industries in which Boston residents are employed. According to the American Community Survey, nearly one-third of Boston residents 16 years or older are employed in education, health care, or social assistance industries (Figure 13). The next most common

industry for Boston residents is professional, scientific, and management; administrative, and waste management services (industry categories are pre-defined by the U.S. Census).

Figure 13. Percent Population 16 Years and Over Employed by Industry, by Boston, 2013–2017

DATA SOURCE: U.S. Census, American Community Survey 5-Year Estimates, 2013–2017

NOTES: Data are arranged in descending order; industry categories are defined by the U.S. Census

According to the BPDA, health care and social assistance, accommodation and food services, and arts, entertainment, and recreation were the industries that had the largest percentage gains in employment over the past 15 years, while manufacturing and utilities had the largest percentage decreases in employment.¹² Production and transportation jobs are concentrated in zip codes in East Boston, South Boston Waterfront, South Boston, and the Back Bay, while consumer services jobs are concentrated in the West End/Beacon Hill, Downtown, South Boston Waterfront, Back Bay, and Fenway/Kenmore. Business services jobs are concentrated in Back Bay, Downtown, and the South Boston Waterfront. Education and health care jobs are concentrated in Roxbury, Fenway/Kenmore, Back Bay, and the West End.

Employment Challenges and Satisfaction

Two main themes emerged from the data collection with Boston residents: employment satisfaction and challenges in securing a competitive job. Numerous Boston CHNA Community Survey respondents reported feeling underemployed, wanting higher pay, or desiring greater job satisfaction. Nearly 30% of Boston CHNA survey respondents indicated that they felt they

had more training and experience than was required to perform their current job, and another 18% indicated this was possibly true (see [APPENDIX I](#)). Of the 978 CHNA survey respondents who answered that they were looking for a new job, the most commonly cited reason for looking was higher pay (33.4%) followed by job satisfaction (21.3%), and more opportunities for advancement (11.2%) (Figure 14).

Figure 14. Percent Boston CHNA Survey Respondents Looking for New Job Reporting Primary Reason for Looking for a New Job (N=978), 2019

DATA SOURCE: Boston CHNA Community Survey, 2019

NOTES: Data arranged in descending order; Percentage calculations exclude respondents who selected “not looking for a new job”

Focus group participants, however, were more likely to discuss the challenges of securing a job rather than job satisfaction itself. These challenges, discussed in more detail below, included meeting educational requirements, changing hiring processes, having appropriate technology skills, and having a criminal record.

Educational Requirements and Training

Many focus group participants discussed how formal educational requirements for a job are a significant initial barrier. As one resident from Dorchester summarized, *“I’ve struggled to get a job. I have more than a decade of experience, but the minimum requirements are always a bachelor’s degree, so that disqualifies you for ten jobs right off the bat.”* Several participants also remarked that many employers do not take into account work or life experience as comparable to educational requirements. As one example focus group participant shared, *“In Boston, just having the credentials they want is difficult. You may have half of the education credentials, 10 years of work experience, and lots of life experience, but they [employers] don’t see [the work or life experience as comparable].”* Several participants discussed how the high cost of college and other educational opportunities was inaccessible to them, especially if they were working, single parents. One focus group participant explained, *“People want to enrich their lives and get an education but how can you without support? Single parents don’t know what to do with their kids, how to get to work; how are we ever supposed to get an education?”*

In addition to access to degree programs or positions that recognized life and work experience, focus group and interview participants identified the need for more trade schools and job centers that can help residents gain skills and training to create pathways beyond entry-level positions. Focus group participants from the South End specifically mentioned carpentry, electrical work, machine training, and small business training as especially valuable. Participants also stressed that it is imperative that training opportunities are accessible to working parents, taking in to consideration issues like childcare, time, and cost. One interviewee summarized, *“There’s a need for employers that are sensitive to single-headed households who can help provide more work-life balance.”*

Hiring Processes and Navigating Technology

Challenges navigating technology and dealing with new hiring processes were also identified as a concern for residents in Dorchester and among senior focus group participants. For example, focus group participants in Dorchester explained that the hiring process has drastically changed over the last 10 years in that nearly all applications are now submitted online. One participant shared, *“It’s hard to get job now because everything is online. When you do the online application, you’re trying to answer the question to the best of your ability, but you have to think outside the box because we are written off so quickly. There’re no more walk-in interviews where you can meet someone and give a good first impression.”* Another participant agreed and added, *“I’m a wonderful person if I could just get in the door.”* Participants in these groups explained that there are many incorrect assumptions about residents’ ability to navigate technology. One Dorchester parent resident shared, *“Not everybody is computer literate. Not everyone has a resume online and that really knocks you down. You just want someone to see that you’re a good person and hard worker, but you can’t do that because there’s no face to face correspondence anymore.”* Similarly, focus group participants who were seniors explained that technology is often a hinderance to remaining competitive in the work force. One shared, *“A lot of elderly do not how to use their cellphone properly. Some classes have been given to help seniors with technology. There needs to be more of that because many of us have the phone but don’t know how to use it.”*

Criminal Record

Having a criminal record also makes it difficult to secure employment, shared focus group and interview participants. Focus group participants who identified as homeless described challenges finding employment because of past criminal charges. One shared, *“You need to remember that CORI¹ is going to limit you in everything...even if you get it sealed. [Employers] say they’ll get back to you and call you, but they never do.”* Key informants described the need for more support from employers for this population. One interviewee explained, *“[There is] a need for more flexible employment policies so that people who have criminal records can have real opportunities to work and turn their lives around. When they are closed off from these positive opportunities, that is when they go further downhill in destructive behaviors.”*

¹ CORI stands for Criminal Offender Record Information and is a record of all criminal court appearances in Massachusetts for a particular individual, including arrests, convictions, dismissals, and serious violations.

Youth Employment Challenges

Focus group participants, especially parents, also discussed the importance of encouraging youth employment, both for young people to learn important skills and to focus their time on positive activities. However, while there are a number of youth workforce programs in the city, many youths find it challenging to get a job. When talking about the limited number of employment opportunities for young people, one parent from Dorchester shared, *“You need to know somebody who knows somebody just for a kid to get a job. Then they have to resort to the streets because they don’t have [anything] else to do.”* Key informant interviewees explained that it is imperative that these opportunities include a focus on technology and “21st century skills” like computer programming, professional communication, and critical thinking. One interviewee shared, *“We [in Boston] are one of the leading markets for technology-enabled industries, and we have young people who do not have access to computer and internet service in their homes. They do everything on their phones but that does not help them fully participate in the economy.”* Further, it was noted that transportation poses a challenge for young people to access employment opportunities, so it is important that jobs are available within their communities or can offset transportation barriers. One interviewee shared, *“Transportation is a major issue that impacts our work. The amount of time it takes to get anywhere does not help kids with after school jobs. Kids ride two buses and a train and then walk for a 2-hour employment experience!”*

Income and Financial Security

Why is This Important?

Income is a powerful social determinant of health. At an individual level, income influences where people live, their ability to access higher education and skills training, and their access to resources to help them cope with stressors, all of which affect health and well-being. Income also shapes access to health-promoting resources such as healthy food, health care, and technological advances (e.g., new medical treatments).¹³ Compared to their higher income counterparts, low-income individuals have higher rates of smoking, obesity, and physical inactivity; more limited access to healthy foods, opportunities for physical activity, and healthy environments; higher rates of physical limitations, heart disease, diabetes, stroke, and other chronic conditions; and more limited access to health care.¹⁴ At a community level, regardless of individual level of income, low community wealth often correlates with more limited educational and job opportunities, greater community violence, environmental pollution and disinvestment in essential infrastructure and resources.¹⁵ While income, education, and employment are all associated with health outcomes in slightly different ways, many of the same population groups—communities of color, women, immigrants, and others—experience the compounded challenges and structural inequities across the myriad of systems related to economic advancement and upward mobility.

The city median household income is \$62,021 but ranges by neighborhood -from Dorchester with the lowest median income at \$27,964 to South Boston with the highest at \$170,152.

Key Findings in this Section

Across all indicators of income and financial security, there are substantial differences across Boston neighborhoods and racial and ethnic groups, that are similarly patterned as other social, economic, and health inequities. The median household income in Boston is \$62,021, but the spread between the community with the lowest median household income (Dorchester, \$27,964) and the highest (South Boston, \$170,152) is substantial. In four communities—Dorchester, Fenway, Roxbury and the South End—approximately 25-35% of residents live below the federal poverty level. Median household income is highest for White residents and lowest for Latino residents. Median value of total assets and net wealth for White residents far exceeds that for any other racial/ethnic group. Poverty and economic instability were key themes in focus groups and interviews, with participants sharing the challenges of meeting basic needs and the negative effects this has on personal health. Community survey results indicate that a substantial number of respondents face challenges paying their mortgages, utility, credit card and medical bills, buying groceries, and paying for childcare. These challenges are experienced by a higher proportion of non-White respondents compared to White respondents, and those without a college degree compared to those who do have a college degree or more.

Household Income and Poverty

Financial insecurity was reported as a concern in the majority of focus groups and interviews, with participants indicating that it was one of the root causes of stress in their lives, and reporting challenges meeting basic needs such as food, shelter, and medical care. Focus group participants across geographies often attributed these financial stressors to stagnant salaries, higher costs of living, and difficulty balancing multiple low-wage jobs. One interviewee summarized, *“Real wages have been going down for low income people [for decades]. This is at the heart of all of it: people have no time because they are working four jobs to get the same salary they used to get from one [job]. If you can’t rest, how can you be healthy? The sleep and the downtime are fundamental, and people have less of it. Some people have to work 70 hours to make ends meet.”*

Census estimates reflect this theme of the burden of limited income affecting many households across Boston. In 2013-2017, one-quarter of Boston households had incomes <\$25,000 (27%) and one in seven households earned between \$25,000 and <\$50,000 (16%), and yet one-third of Boston households earned \$100,000 or more (Figure 15). The neighborhoods of Allston/Brighton and East Boston most closely resembled the socioeconomic profile across Boston. Roxbury (44%), Fenway (40%), Dorchester (02121, 02125; 36%), and the South End (31%) had the highest proportion of households with incomes below \$25,000.

Figure 15. Household Income Distribution, by Boston and Neighborhood, 2013–2017

DATA SOURCE: U.S. Census, American Community Survey 5-Year Estimates, 2013–2017

NOTE: Neighborhoods as defined by Boston Public Health Commission; Back Bay includes Back Bay, Beacon Hill, Downtown, North End, and West End; South End includes South End and Chinatown

As described below, both the average and median household incomes are important examine. These numbers should be close if there is not much variation or unequal extremes in a group. While the average (or mean) of a setting is often examined, the median provides the mid-point, where 50% of the sample is above that number and 50% is below. Figure 16 represents on the map those neighborhoods whose median income was significantly lower (light blue) or significantly higher (dark blue) than Boston overall.

More detailed data on the specific median and average incomes by neighborhood can be found in [APPENDIX I](#).

These data indicate that the average household income was highest in Back Bay (02110; \$256,500) and South Boston (02210; \$212,297) in 2013–2017. The 02121 neighborhood in Dorchester had the lowest average (\$45,874) and median (\$27,964) household income over this period, with the average household income in Dorchester being 82% lower than that in Back Bay. The 02119 and 02120 neighborhoods in Roxbury both were among the lowest average (\$49,233 and \$51,456) and median (\$30,663 and \$32,243) household incomes, respectively. There are notable differences between the average and median household incomes in zip codes

that comprise the South End, where the average income is 83%-286% higher than the median income, depending on the zip code.

Figure 16. Median Household Income (in U.S. Dollars), by Zip Code, 2013–2017

DATA SOURCE: U.S. Census, American Community Survey 5-Year Estimates, 2013–2017

NOTE: “Lower than Boston overall” indicates the estimate is significantly lower than the Boston estimate; “Similar to Boston overall” indicates the estimate is statistically similar to the Boston estimate (i.e., no statistically significant difference); “Higher than Boston overall” indicates the estimate is significantly higher than the Boston estimate

Reflecting patterns of residential segregation that underlie inequities in household income across Boston neighborhoods, there were significant racial/ethnic differences in median household income relative to the average for Boston (Figure 17). White households (\$98,317)

reported incomes that were 47% higher than the city average (\$66,758). Asian (\$47,048), Black (\$39,344), and Latino (\$36,998) households earned significantly less than the average across Boston. Notably, while White households reported incomes that were approximately \$30,000 above the city average, Latino and Black households brought home incomes that were \$30,000 below the median income across Boston.

Figure 17. Median Household Income, by Boston and Race/Ethnicity, 2017

DATA SOURCE: U.S. Census, American Community Survey 1-Year Estimates, 2017

NOTE: Asterisk (*) denotes race/ethnicity estimate was significantly different compared to the Boston estimate ($p < 0.05$); Error bars show 95% confidence interval

Given high cost of living in Boston and the low federal poverty line, those who fall below the poverty level are at the extreme end of financial insecurity. The federal poverty line changes by housing size; for a household of one, the 2019 federal poverty line is an annual income of \$12,490; for a household of four, it is \$25,750. Figure 18 indicates that one in five Boston residents (20.5%) meet this criterion for the 2013-2017 aggregate American Community Survey data, although this situation varies by neighborhoods. The percent of residents living below the federal poverty level was highest in Fenway (36.7%) and Roxbury (34.4%) in 2013-2017, followed by Dorchester (02121, 02125; 28.4%), and the South End (24.6%). West Roxbury (6.4%) had the lowest proportion of residents living below the federal poverty level in 2013-2017.

The percentage of the population living in poverty also differs significantly by race/ethnicity. Using just 2017 data, Asian residents, at nearly 31%, and Latino residents, at nearly 28%, are significantly more likely to be in poverty than Boston residents overall. White residents are significantly less likely, at nearly 11% (Figure 19).

Figure 18. Percent Population Living Below Poverty Level, by Boston and Neighborhood, 2013–2017

DATA SOURCE: U.S. Census, American Community Survey 5-Year Estimates, 2013–2017

NOTE: Neighborhoods as defined by Boston Public Health Commission; Back Bay includes Back Bay, Beacon Hill, Downtown, North End, and West End; South End includes South End and Chinatown; Asterisk (*) denotes neighborhood estimate was significantly different compared to the Boston estimate ($p < 0.05$); Error bars show 95% confidence interval

Figure 19. Percent Individuals Below Poverty Level, by Boston and Race/Ethnicity, 2017

DATA SOURCE: U.S. Census, American Community Survey 1-Year Estimates, 2017

NOTE: Asterisk (*) denotes race/ethnicity estimate was significantly different compared to the Boston estimate ($p < 0.05$); Error bars show 95% confidence interval

Patterns of poverty at the family level largely mirror patterns for individuals in poverty. Data on Boston families living below the federal poverty line can be found in [APPENDIX I](#). Given Boston's high cost of living, looking at data on those who are right above the poverty line is also important. [APPENDIX I](#) also includes data on individuals with incomes at 200% below the poverty line by neighborhood.

Income Inequality and the Wealth Gap

Income inequality of a community is expected to have direct effects on an individual's own income status, as well as indirect effects that can affect health, regardless of one's own income status. Studies have discussed that increases in income inequality could affect the availability of goods and services, the enforcement of laws banning unsafe consumer products, the benefits and costs of higher education, the social bonds among relatives and neighbors, or the

distribution of political influence¹⁶. The Gini Index is a common measure used to identify the level of income inequality in a given population, ranging from 0 (generally reflecting income equality) to 1 (generally indicating highest levels of income inequality). As shown in Figure 20, the Gini Index ranged from a low of 0.42 (02210 zip code in South Boston and 02163 zip code in Allston/Brighton) to a high of 0.67 (02111 zip code in the South End). Income inequality was also higher in Back Bay (02110; 0.64) and Fenway (02115 and 02215 zip codes; 0.60-0.61). See [APPENDIX I](#) for additional detail.

Figure 20. Gini Index, by Zip Code, 2013–2017

DATA SOURCE: U.S. Census, American Community Survey 5-Year Estimates, 2013–2017

NOTE: The Gini Index is a summary measure of income inequality. The Gini coefficient incorporates the detailed shares data into a single statistic, which summarizes the dispersion of income across the entire income distribution. The Gini coefficient ranges from 0, indicating perfect equality (where everyone receives an equal share), to 1, perfect inequality (where only one recipient or group of recipients receives all the income). The Gini is based on the difference between the Lorenz curve (the observed cumulative income distribution) and the notion of a perfectly equal income distribution; “Lower than Boston overall” indicates the estimate is significantly lower than the Boston estimate; “Similar to Boston overall” indicates the estimate is statistically similar to the Boston estimate (i.e., no statistically significant difference); “Higher than Boston overall” indicates the estimate is significantly higher than the Boston estimate

Numerous participants across focus groups perceived that there is growing economic inequality in communities of color compared to their White counterparts. People noted the gentrification of neighborhoods and rising cost of living was having a disproportionate impact on lower income families and communities of color. As one key informant interviewee described, “A lot of our minority families in Roxbury and Dorchester can never make it into the middle class. Our families are being pushed out to cities like Brockton and Randolph and then aren’t able to access city resources.”

Data on wealth were not available for the City of Boston, but studies have looked at the wealth of the Boston Metropolitan Statistical Area (MSA) which is comprised of Massachusetts Counties of Norfolk County, Plymouth County, Suffolk County, Middlesex County, Essex County and New Hampshire Counties of Rockingham County, NH and Strafford County, NH. In a Federal Reserve Bank of Boston 2015 report which focused on examining wealth disparities between residents who identify as White, U.S. born Black, Caribbean Black, Cape Verdean, Puerto Rican, and Dominican, the median value of total assets for White residents in the Boston Metropolitan Statistical Area (\$256,500) far exceeded the assets reported for any racial/ethnic minority group in 2014 (Figure 21). Among residents of color, the highest household assets were reported among non-Caribbean Hispanic residents (\$15,000), followed by residents who identified as Caribbean Black (\$12,000). Of note, Cape Verdean (\$0) and Black/African American residents (\$700) had the lowest reported household assets in 2014. Data on net worth, which can be found in [APPENDIX I](#), show similar patterns. These patterns reflect themes in focus groups and interviews suggesting that residents of color across Boston are struggling to make ends meet, let alone get ahead financially.

Figure 21. Median Value of Total Assets Reported to be Held by Households (in U.S. Dollars), by Boston Metropolitan Statistical Area, 2014

DATA SOURCE: Duke University, National Asset Scorecard for Communities of Color (NASCC), Boston NASCC survey, as analyzed and reported by Muñoz, A. P. et al, Federal Reserve Bank of Boston, The Color of Wealth in Boston (2015), 2014

NOTES: Boston Metropolitan Statistical Area includes the following Massachusetts counties: Essex County, Middlesex County, Norfolk County, and Suffolk County, and Rockingham County, New Hampshire and Strafford County, New Hampshire; Asterisk denotes where the difference in the percentage of nonwhites as compared with the percentage of white households was statistically significant at the 95% level; The “not elsewhere classified” (NEC) category includes mainly respondents that chose more than one race; This study focused on U.S. born Black, Caribbean Black, Cape Verdean, Puerto Rican, and Dominican differences and did not report data on other racial/ethnic groups, such as Asian or Native American/American Indian residents.

Challenges of Financial Insecurity

Financial insecurity was a major theme across many focus groups. Participants talked about the challenges of making ends meet. As one participant noted, *“Even if rent goes up \$50 or \$100 a month, it’s a lot when your income is not growing.”* In particular, participants talked about challenges with being stuck in low-wage jobs, with little room for advancement, and how that made it difficult to maintain a good quality of life. For example, in East Boston and Dorchester, parents spoke of working hourly wage jobs that were inconsistent and unstable. One resident from Dorchester illustrated her challenge in being in a low wage job without much autonomy or flexibility in schedule, *“I’m a single mother and told my jobs that I can’t work night shifts when I applied. But still they schedule me for hours I can’t do and then they can fire you if you don’t make the shifts. They pick and choose whatever hours they want to give you.”* A few focus group participants who identified as low-wage mentioned that raising the minimum wage in Massachusetts is a step in the right direction to financial stability; however, more is needed to help working poor and lower middle-class families.

Across most groups, participants spoke of having to live paycheck to paycheck and being unable to save any additional income for emergencies. One low-income parent shared, *“There are lots of financial needs here in East Boston. People are working 2 or 3 jobs, and even if you live simply, your salary breaks even. There is no extra money.”* Residents who are in the lower middle class also described struggles to maintaining financial stability, mentioning limited resources to help families attain upward mobility. One focus group participant from the South End shared, *“People working are making too much to get food stamps—but not enough to feed their family. The middle class is struggling; you’re back to surviving and not living.”*

According to key informants and non-English focus group participants, residents who were undocumented and new immigrants were especially vulnerable to financial instability between no documentation, limited power, and the desire to support their families in their country of birth. One undocumented resident shared, *“The problem is that people have social security numbers- lots of people who don’t have papers. And [employers] can pay you very little because they know you can’t report them. I get paid \$40 a day to work very long days and take care of someone else’s kids.”* A focus group participant in Mattapan echoed this sentiment, sharing, *“We are unable to support each other, and we should be trying to invest in ourselves, but we still need to send transfer money to Haiti [every month].”*

“Families who are lower middle income are trying to get out of the grey area but are stuck. If they get a raise and advance, then they don’t qualify for services.”—Key informant interviewee — From a key informant interviewee

Multiple focus group participants also described what is known as ‘the cliff effect’- when a minor increase in income can cause a swift and total loss of benefits that are often more than the financial raise. One interviewee explained, *“One big obstacle for those we serve is the cliff effect. As [residents] start to increase their income, their benefits drop off. Navigating that is a challenge and there’s a real fear around that.”* Focus group residents who identified as low-income echoed this sentiment, with some describing experiences of losing health insurance or other benefits as a result of picking up even a few extra hours of work a week. One Mattapan resident shared, *“I got 4 extra hours at my job and MassHealth cut me off and I couldn’t afford*

my pills for weeks after that.” Loss of benefits was also a concern as it related to childcare, with one interview sharing: *“Parents who need to work in order to provide for their families is often a hard choice for mothers who need to ask themselves’ do I stay home and stay on the benefits I’m receiving, or do I find childcare, so I can work?”* This sentiment was echoed by focus group participants who were mothers, with one sharing, *“I get paid \$40 a day and the YMCA charges me \$60 a day for childcare. It’s impossible for a single mom like me to pay that.”*

These forms of financial insecurity that emerged in focus groups and interviews echo estimates from the Federal Reserve indicating neighborhood variation in delinquent payments and poor credit scores. Approximately one in five residents in Roxbury (22%), Mattapan (21%), and Dorchester (18%) were delinquent in a payment in 2017, similar to the average across Boston (19%) that same year (Figure 22). (It should be noted that the neighborhood definitions used for the Federal Reserve study are slightly different than the definitions used throughout the rest of this report.)

Figure 22. Percent Population Delinquent in Payment, by Boston and Neighborhoods, 2017

DATA SOURCE: Federal Reserve Bank of New York (FRBNY) Consumer Credit Panel/Equifax, as cited in Federal Reserve Bank of Boston, *The Concentration of Financial Disadvantage: Debt Condition and Credit Report Data in Massachusetts Cities and Boston Neighborhoods* (2018), 2017Q2

NOTE: Neighborhoods are defined per Boston Planning & Development Authority definitions (<http://www.bostonplans.org/getattachment/d09af00c-2268-437b-9e40-fd06d0cd20a2>)

While data on average credit scores can be found in [APPENDIX I](#), Figure 23 presents data by neighborhood on the percent of the population with subprime credit scores. The proportion of residents with subprime credit scores ranged from a low of 8% in Beacon Hill to a high of 51% in Roxbury. The neighborhoods of Roxbury (51%), Mattapan (48%), Dorchester (43%), and Hyde Park (38%) had the highest proportion of residents with subprime credit scores.

Figure 23. Percent Population with Subprime Credit Score (< 660), by Boston and Neighborhoods, 2017

DATA SOURCE: Federal Reserve Bank of New York (FRBNY) Consumer Credit Panel/Equifax, as cited in Federal Reserve Bank of Boston, The Concentration of Financial Disadvantage: Debt Condition and Credit Report Data in Massachusetts Cities and Boston Neighborhoods (2018), 2017Q2

NOTE: Neighborhoods are defined per Boston Planning & Development Authority definitions (<http://www.bostonplans.org/getattachment/d09af00c-2268-437b-9e40-fd06d0cd20a2>)

Boston CHNA survey respondents were asked whether they had troubles financially in several different areas. As shown in Figure 24, the most common form of financial insecurity reported among Boston CHNA survey respondents was saving money (57%). One quarter of respondents reported challenges in paying credit card bills (24%) or purchasing groceries (23%). One in five respondents indicated trouble paying utilities (22%), rent/mortgage (20%), and medical bills (19%).

Figure 24. Percent Boston CHNA Survey Respondents Reporting Having Trouble with Finances, by Type of Finances, 2019

DATA SOURCE: Boston CHNA Community Survey, 2019

NOTES: Percentage calculations do not include respondents who selected "don't know/prefer not to answer"

While more than half (57%) of Boston CHNA survey respondents reported having trouble saving money, there was significant variation in reports of having trouble saving money across racial/ethnic groups, age groups, gender identity, educational attainment, and parent status (Figure 25). The prevalence of barriers to saving money was highest among respondents with some college/certificate program education (75%), Black respondents (67%), Latino respondents (66%), parents of children <18 years of age (64%), and multi-racial (63%) respondents. [APPENDIX I](#) includes additional analyses of the survey questions on financial troubles.

Figure 25. Percent Boston CHNA Survey Respondents Reporting Having Trouble with Saving Money, by All Respondents and Selected Indicators, 2019

DATA SOURCE: Boston CHNA Community Survey, 2019

NOTE: Chi-square analyses were conducted and there were statistically significant differences within the following groups ($p < 0.05$): race/ethnicity, age, gender identity, educational attainment, and parent status

Receipt of assistance from an organization is an important indicator of financial insecurity. This indicates the challenge of living paycheck to paycheck and not being unable to save money for emergencies, a common theme that emerged in focus groups and interviews. When asked about their receipt of assistance from an organization or program in the past year, 16.1% of Boston CHNA survey respondents reported receiving food assistance (Figure 26). Nearly one in ten respondents (9.8%) indicated receipt of housing assistance, and around 7% reported receiving transportation-, medication-, and utility-related assistance.

Figure 26. Percent Boston CHNA Survey Respondents Reporting Receiving Assistance from Organization or Program in Past 12 Months, by Type of Assistance (n=1,773), 2019

Food Insecurity

Why is This Important?

Food insecurity—not having reliable access to a sufficient quantity of affordable, nutritious food—is directly related to financial insecurity. Few Americans meet nutritional guidelines, as indicated by daily consumption of fruit and vegetables.¹⁷ Inadequate financial resources and limited access to healthy, affordable food contribute to these patterns.^{18,19} Food insecurity has substantial negative effects on health: research has shown that people experiencing food insecurity have lower nutritional intakes, increased rates of mental health problems and depression, higher rates of diabetes and hypertension, and worse oral health.²⁰

“I’m working three jobs and I can barely afford food; I buy whatever I need to feed my kid and that’s it.” — From a key informant interviewee

Key Findings in This Section

The expense and accessibility of healthy food was a key area of concern shared by focus group participants and interviewees. While more affluent neighborhoods were described as having substantial access to healthy food, lower income neighborhoods, most commonly communities of color, were described as having few grocery stores and a prevalence of fast food and convenience stores. The proportion of Boston adults experiencing food insecurity has declined from 2010 to 2017; however, 17% of residents still experience food insecurity. Black, Latino,

and foreign-born residents are far more likely to report being food insecure than White or U.S.-born residents. Nearly 20% of Boston residents receive benefits from the Supplementation Nutrition Assistance Program (SNAP). In focus groups, food assistance programs were described as filling a critical gap for those facing difficulty accessing food. Enhancing food access through expansion of community gardens, food prescription programs, and hours and selections at food pantries was suggested.

Experiences with Food Insecurity

Key informant interviews and low-income focus group participants across neighborhoods discussed the challenge of not having enough money to afford food. As one focus group participant remarked, *“I’m working three jobs and I can barely afford food; I buy whatever I need to feed my kid and that’s it.”* While housing might be the largest cost to a family’s budget in Boston, the cost of food was still challenging for many. As one key informant explained, *“A lot of people spend money on food after utilities and health care; whatever is left goes to food.”* Focus group participants echoed this sentiment and described having to eat canned or processed food that contain high levels of sodium and low-nutritional value because they felt like that was what they could afford.

Focus group and interview participants identified seniors and children as being especially vulnerable to being food insecure. Key informants who worked with seniors described mobility and mental health issues that compounded challenges for them to access healthy food. One key informant shared, *“Many seniors are homebound and food delivery is one of their only contacts with the outside world.”* Those who worked with children explained that food insecurity impacts a child’s stress levels, ability to pay attention at school, lower test scores, and absences.

Quantitative data indicate that over one in five Boston residents reported being food insecure, in that it was sometimes or often true that the food they have purchased did not last and they did not have money to get more. Experiences with food insecurity varied by population group (Figure 27). In aggregated 2013, 2015, and 2017 BBRFSS data, Latino (39.1%) and Black (34.5%) residents were significantly more likely than White residents (10.7%) to report being food insecure as were foreign-born residents compared to U.S. born residents. Food insecurity data by neighborhood, which can be found in [APPENDIX I](#), indicate that Mattapan, Roxbury, Dorchester, and East Boston had a significantly higher percentage of residents than the rest of Boston who reported being food insecure.

Figure 27. Percent Adults Reporting Food Purchased Did Not Last and Did Not Have Money to Get More, by Boston and Selected Indicators, 2013, 2015 and 2017 Combined

DATA SOURCE: Boston Public Health Commission, Boston Behavioral Risk Factor Surveillance System, 2013, 2015, and 2017 combined

DATA ANALYSIS: Boston Public Health Commission, Research and Evaluation Office

NOTES: Data show percentage of adults reporting it was sometimes or often true that the food didn't last and they did not have money to get more; Bars with pattern indicate reference group for its specific category; Asterisk (*) denotes where estimate was significantly different compared to reference group within specific category ($p < 0.05$); Error bars show 95% confidence interval

The 2019 Boston CHNA Community Survey asked a similar food insecurity question to Boston residents. Among this sample, one-third of respondents indicated that in the past 12 months they felt it was sometimes or often true that they worried that their food would run out before they had money to buy more (Figure 28). Examining data by primary language spoken, nearly two-thirds of the survey respondents (63.2%) who spoke Haitian Creole reported being food insecure, although it should be noted that the sub-sample only included 54 respondents. More than half of Spanish-speaking survey respondents (51.8%) reported feeling food insecure.

Figure 28. Percent Boston CHNA Survey Respondents Reporting That It Was Sometimes or Often True That They Worried That Their Food Would Run Out Before They Got Money to Buy More in Past 12 Months, by All Respondents and Primary Language Spoken, 2019

DATA SOURCE: Boston CHNA Community Survey, 2019

NOTES: Question was worded: "In the last 12 months, have you worried that your food would run out before you got money to buy more?" and respondents were asked to select one of the following response options: often true, sometimes true, never true, and prefer not to answer; Percentage calculations do not include respondents who selected "prefer not to answer"

Being on Medicaid is another indicator of financial insecurity and another potential risk factor for food insecurity. Food insecurity questions are now being asked of MassHealth patients in the new Accountable Care Organizations (ACOs) in the city. Among MassHealth patients screened in primary care settings in the Partners Health care System and Boston Medical Center, 33% indicated that in the past 12 months, they were worried they would run out of food before they had money to buy more as well as that the food they had bought did not last and they did not have money to buy more (Table 6 and Table 7).

Table 6. Boston MassHealth Patients from Partners Health care and Boston Medical Center Screened for Social Needs and Worried Their Food Would Run Out in the Past 12 Months

Total Screened	# Worried Food Would Run Out	% Worried Food Would Run Out
7,848	2,605	33%

DATA SOURCE: Social Needs Screening Data, Partners Health care and Boston Medical Center (BMC), 2018

NOTES: Analyses only among MassHealth ACO primary care patients and Boston residents

Positive screen for patients who indicated it was *often* or *sometimes true* that within the past 12 months, they worried whether food would run out before they had money to buy more.

Table 7. Boston MassHealth Patients from Partners Health care and Boston Medical Center Screened for Social Needs Who Ran Out of Food in the Past 12 Months

Total Screened	# Ran Out of Food	% Ran Out of Food
7,863	2,616	33%

DATA SOURCE: Social Needs Screening Data, Partners Health care and Boston Medical Center (BMC), 2018

NOTES: Analyses only among MassHealth ACO primary care patients and Boston residents

Positive screen for patients who indicated it was *often* or *sometimes true* that within the past 12 months, the food they bought just didn't last and they didn't have money to get more.

Additional food insecurity data on the percentage of Boston residents who reported feeling hungry but did not eat because they could not afford food, by selected characteristics and by neighborhood, can be found in [APPENDIX I](#).

Use and Perceptions of Food Assistance and Access

Residents across multiple focus groups discussed that assistance programs and community services are critical to help those who are challenged with affording food. Focus group participants described community gardens and farmer's markets as strengths in their communities that can be leveraged; though participants stressed that it is imperative that these initiatives continue to consider cost and accept SNAP benefits. Community gardens were described to have a dual focus of cleaning up neighborhood land and ensuring access to affordable food. Specific organizations that were mentioned as assets include The Urban Farming Institute and Mattapan Food and Fitness Coalition. In Chinatown, key informants described the opportunity to create more roof-top community gardens to provide healthy food and address environmental concerns in the neighborhood. It was noted that engaging young people in these initiatives is imperative for sustainability and intergenerational connections.

Nearly 20% of Boston residents receive benefits from the Supplementation Nutrition Assistance Program (SNAP) (formerly food stamps) (Figure 29). For Dorchester (zip codes 02121, 02125) and Roxbury, approximately one-third of residents receive SNAP benefits. Rates are significantly higher among Dorchester, Roxbury, Mattapan, and the South End than Boston overall.

Figure 29. Percent Households Receiving Food Stamps/SNAP Benefits, by Boston and Neighborhood, 2013–2017

DATA SOURCE: U.S. Census, American Community Survey 5-Year Estimates, 2013–2017

NOTE: Neighborhoods as defined by Boston Public Health Commission; Back Bay includes Back Bay, Beacon Hill, Downtown, North End, and West End; South End includes South End and Chinatown; Asterisk (*) denotes neighborhood estimate was significantly different compared to the Boston estimate ($p < 0.05$); Error bars show 95% confidence interval

Further, there were suggestions to strengthen initiatives that address food access from a clinical perspective, where practitioners can prescribe services and are reimbursed as part of the ACO plans. One interviewee shared, “We need to be looking into things like Medicaid reimbursements for food prescriptions and health incentive programs for SNAP benefits that incentivize residents to buy healthy food.” Similarly, senior focus group participants discussed the positive impact of these initiatives with one sharing, “One benefit about being a patient at BMC is that in the Spring and Summertime you can have fresh vegetables and fruit from their rooftop garden.” Other suggestions from key informants include: strengthening the network of

food distributors, especially in low-income communities; giving residents financial independence to have autonomy of what they can purchase with SNAP benefits; having food pantry hours that are accessible to working families; and providing healthier options at food pantries to include more fresh produce, meat, and dairy.

SOCIAL AND PHYSICAL ENVIRONMENT – WHAT IS THE COMMUNITY CONTEXT FOR BOSTON RESIDENTS?

Housing

Why is This Important?

Where people live is integral to their daily lives, health, and well-being. The conditions in the home and neighborhood environment may promote health or be a source of exposures that may increase the risk of adverse health outcomes.²¹ Housing is generally the largest household expense. For homeowners, it can be an important source of wealth.²² However, housing instability and stress of housing affordability have been found to be associated with poorer mental health outcomes and disruptions in work, school, and day care arrangements.²³ Housing instability has been associated with poorer outcomes for children related to risk for developmental delays, being underweight, and lower school attendance. Poor housing quality can have direct negative health impacts such as respiratory conditions (e.g., asthma) due primarily to poor indoor air quality—and can be one of the strongest drivers for asthma-related emergency department visits among children. Housing conditions can also result in cognitive delays in children from exposure to neurotoxins (e.g., lead), and accidents and injuries as a result of structural deficiencies.²⁴

Key Findings in this Section

The high and rising cost of housing in Boston was a main theme that emerged in discussions with focus group participants and interviewees. Two-thirds (65%) of housing units across Boston are renter-occupied and renter households spend an average of \$1,445 per month on housing. More than half of those in renter-occupied units are housing cost-burdened, meaning they spend more than 30% of their income on housing.

More than half of Boston renter households spend 30% or more of their income on housing costs.

A significantly higher proportion of households in East Boston, Fenway, Roslindale and South Boston are cost-burdened than those in other neighborhoods; additionally, Black home owner and renter households are significantly more likely to spend 30% or more of their income on housing, compared to the Boston average. Assessment participants' perceptions of increasing housing costs are mirrored in the statistics: from 2011 to 2016 median single-family house prices increased across every neighborhood in Boston and the median price increased by 48% in Boston overall. Additional pressures include gentrification, long wait lists for housing assistance programs, and for some, housing discrimination. Overcrowding, homelessness, and poor quality housing were reported to be consequences of a tight and expensive housing market. Housing costs comprise a large and ever-increasing portion of household budgets, interviewees and focus group members report, leaving few resources for other needs such as health care, medicine, or nutritious food. There was general consensus across conversations

that more affordable housing is needed in Boston, although quantitative data suggest that the proportion of affordable housing to market rate housing is decreasing.

Housing Burden and Affordability

Lack of affordable housing was a prominent theme that arose across all key informant interviews and focus groups. Participants across geographies consistently shared that the rising cost of living in Boston was a major day-to-day concern. Most participants reported a need for more affordable housing for low and moderate-income levels. Quantitative data also indicate that the proportion of affordable housing to market rate is decreasing, rather than increasing. Even with the growth in development, the proportion of affordable housing units in total production in Boston has been falling since 2003. In the period 1996 to 2003, more than 39 percent of all permits were for affordable units. In the following period, 2004–2010, the proportion was down to less than 26 percent, and from 2011–2016, the proportion has fallen to about 18 percent.²⁵ It should be noted, however, that in 2018, the City of Boston documented that the number of income-restricted affordable units in Boston was 19%, or nearly one in five. This is the highest ratio of income-restricted housing in any major city in the United States.²⁶ Boston has further committed to maintain this one in five ratio as part of the housing production and preservation plan that is currently underway, and is working to raise the number of income-restricted affordable units from 54,000 to 70,000 by the year 2030.

Several focus group and interview participants noted that high housing costs were particularly difficult for people with low or fixed incomes, such as seniors and residents who work low-wage jobs. Many described the influx of housing developments being built across the city but perceived that the cost of these units was often inaccessible to the average resident. One focus group participant shared, *“The people who live here do not have access to the new apartments coming up in East Boston. How are we supposed to access rents that are \$2,000-3,000 and maintain a life?”*

Housing cost data aligns with resident and leader concerns cited during focus groups and interviews. Housing costs are a larger economic burden for renters in the city. (See [APPENDIX I](#) for additional data on percent of housing units that are renter- and owner-occupied.)

According to the American Community Survey, more than half (52.1%) of renter-occupied units and one-third (35%) of owner-occupied units across Boston spent 30% or more of their income on housing costs (Figure 30 and Figure 31). A significantly higher proportion of residents in rental units in Roslindale (62%), South Boston (60%), Fenway (59%), East Boston (59%), and Jamaica Plain (58%) spent at least 30% of their income on housing costs, compared to the Boston overall average. Similarly, compared to Boston overall, a significantly higher proportion of residents of owner-occupied units in East Boston (47%), South Boston (47%), Roslindale (45%), Hyde Park (43%), and Fenway (41%) spent at least 30% of their income on housing.

Figure 30. Percent Housing Units Where 30% or More of Income Spent on Monthly Housing Costs, by Renter, by Boston and Neighborhood, 2013-2017

DATA SOURCE: U.S. Census, American Community Survey 5-Year Estimates, 2013-2017

NOTE: Neighborhoods as defined by Boston Public Health Commission; Back Bay includes Back Bay, Beacon Hill, Downtown, North End, and West End; South End includes South End and Chinatown; Asterisk (*) denotes neighborhood estimate was significantly different compared to the Boston estimate ($p < 0.05$)

Figure 31. Percent Housing Units Where 30% or More of Income Spent on Monthly Housing Costs, by Owner with Mortgage, by Boston and Neighborhood, 2013-2017

DATA SOURCE: U.S. Census, American Community Survey 5-Year Estimates, 2013-2017

NOTE: Neighborhoods as defined by Boston Public Health Commission; Back Bay includes Back Bay, Beacon Hill, Downtown, North End, and West End; South End includes South End and Chinatown; Asterisk (*) denotes neighborhood estimate was significantly different compared to the Boston estimate ($p < 0.05$)

As discussed above, across Boston and each of the four largest racial/ethnic groups, a higher proportion of renter-occupied units spent at least 30% of their income on housing compared to home owners (Figure 32). In 2017, 48% of Black households that own their homes and 59% of Black households that rent their homes were spent 30% or more of their income on housing, compared to the Boston average, a significant difference. In contrast, 25% of White households that own their homes and 41% of White households that rent their homes spent at least 30% of their income on housing, significantly less than the Boston average.

Figure 32. Percent Housing Units Where 30% or More of Income Spent on Monthly Housing Costs by Housing Tenure, by Boston and Race/Ethnicity, 2017

DATA SOURCE: U.S. Census, American Community Survey 1-Year Estimates, 2017

NOTE: Asterisk (*) denotes race/ethnicity estimate was significantly different compared to the Boston estimate ($p < 0.05$)

While the previous graphs indicated that Roslindale, South Boston, Fenway, East Boston, and Jamaica Plain had the highest percentage of residents spending at least 30% of their income on housing costs, these were not the neighborhoods, except South Boston, with the highest rental costs. South Boston, Back Bay, and Allston/Brighton had the highest monthly rental prices. Dorchester (\$812) and Roxbury (\$917 and \$1,074) had the lowest rental costs per month. Overall, Boston households spent an average of \$1,445 per month on housing if they rent and \$2,293 per month if they owned their housing unit with a mortgage. [APPENDIX I](#) includes detailed data on average monthly housing costs by zip code. Compared to similarly sized cities, these figures are similar to Washington DC, but less expensive than San Francisco, CA and more expensive than Denver, CO.

Median monthly housing costs for renter households differed by race/ethnicity. The average rent for White (\$1,849) households was significantly higher than Boston overall, while it was significantly lower for Black (\$1,234) and Latino (\$1,142) households. Rental costs for Asian households (\$1,527) were similar to the average across Boston (Figure 33).

Figure 33. Median Monthly Housing Costs, by Boston and Race/Ethnicity, 2017

DATA SOURCE: U.S. Census, American Community Survey 1-Year Estimates, 2017

NOTE: Asterisk (*) denotes race/ethnicity estimate was significantly different compared to the Boston estimate ($p < 0.05$)

Given the concerns raised about housing affordability in focus groups and interviews, it is not surprising that housing costs have risen in the past several years. From 2011 to 2016, the median price for single-family homes in Boston increased by 48%, from \$359,000 (2011) to \$530,000 (2016) (See [APPENDIX I](#) for detailed tables on home prices.) Home prices increased in each neighborhood over this period for which data were available. The largest increase in home prices was seen in East Boston (152%) and Roxbury (107%).

According to key informants and most focus group participants who identified as low-income, housing costs comprise a large part of spending for their households, leaving few resources for other needs such as health care, medicine, or nutritious food. One interviewee shared, “*Many folks who are rent burdened are paying [up to] 50% of their income in rent; most of their resources going to this very essential need. The choices that people have to make—whether its not being able to ever take a vacation, not being able to purchase clothing or pay your bills... causes immense stress and mental health issues for care takers and children.*” The notion that children adopt the stressors of rising housing costs was also noted by multiple key informants with experience working with children. One shared, “*Kids can feel when their parents are stressed because maybe the landlord raised the rent or something broke in the house. They’re one situation away from eviction.*”

Further, some interview and focus group participants reported instances of residents staying in emotionally or physically un-healthy environments because they could not afford other circumstances. For example, one interviewee shared, “*[Lack of] affordable housing affects the most vulnerable in a lot of ways. It can create unsafe situations in cases like abuse or violence in the home when there is no other place to go.*” Participants indicated that residents who are undocumented and those that do not speak English are particularly vulnerable for this type of abuse.

Similar to focus group and interview participants, Boston CHNA community survey respondents also indicated that housing costs were a heavy burden for their household. As shown in Figure 34, one in five (19.5%) Boston CHNA community survey respondents reported having trouble paying their rent or mortgage. Survey responses to this question significantly differed by

race/ethnicity, age, gender identity, educational attainment, LGBTQ status, and parent status. Data by these selected indicators are available in [APPENDIX I](#) for the percentage of Boston CHNA survey respondents who reported experiencing challenges in paying their monthly utilities.

Figure 34. Percent Boston CHNA Survey Respondents Reported Having Trouble Paying Rent/Mortgage, by All Respondents and Selected Indicators, 2019

DATA SOURCE: Boston CHNA Community Survey, 2019

NOTE: Chi-square analyses were conducted and there were statistically significant differences within the following groups ($p < 0.05$): race/ethnicity, age, gender identity, educational attainment, sexual orientation, and parent status

Similar to patterns that emerged in focus groups, Boston CHNA survey respondents reported their reasons for moving as related to the shifting housing market, costs of living, and family circumstances. Among the Boston CHNA survey respondents who reported moving in the past five years, the primary reasons for their move were: to be closer to work, school or family (19.5%); and issues paying rent or mortgage (16.3%) (See [APPENDIX I](#) for more detailed data).

Gentrification and Housing Costs

Gentrification, generally used to describe the displacement of low-income communities by affluent outsiders, was mentioned across **all** focus groups and interviews and was directly correlated with unaffordable housing costs. Many focus group participants spoke of experiences being “priced out” of neighborhoods and perceived that there was an influx of more affluent, White, community residents across the city. Focus group participants and key informants shared that while displacement was impacting all of the neighborhoods across Boston, it was

disproportionately impacting communities of color, especially those in Dorchester, Roxbury, Mattapan, and East Boston. One informant summarized, *“White community members are flocking to Dorchester and Roxbury when it’s historically consisted of low-income communities of color.”*

Further, gentrification was perceived by multiple key informants to have resulted in families living further away from social service agencies and specialty care, further exacerbating issues of access. One interviewee explained how, *“There’s been a dramatic increase in housing costs in the last several years. You’re seeing more [immigrant] families unable to meet the pressure and are being pushed out to places like Quincy and Randolph because they cannot afford Dorchester...making it harder to access socialization for seniors, health care, linguistic resources. What is going to happen when a majority of constituents are no longer in the city?”*

Gentrification often was discussed in a negative light, with residents perceiving that gentrification in their neighborhoods contributed to increasing rents and property values. East Boston residents discussed the challenges of living a quality life as housing costs steadily becoming unaffordable. One shared, *“Rent is becoming impossible in East Boston...it’s hard to have a good quality of life here. There are all of these high rises, but we don’t get to access those nice things. People are coming here to take what we have been building for decades.”*

Homeownership was discussed as a means to acquire wealth and stability; however, it was noted by several key informants that opportunities for homeownership were not as accessible to communities of color. One interviewee explained how children from neighborhoods being impacted by gentrification are growing up without models of what homeownership can look like in non-White communities. One interviewee shared, *“We live in a culture where many of our Black and Latino kids only know renting. They associate homeownership with White families and something as unattainable for their families.”*

While most assessment participants viewed gentrification negatively, a few spoke of the unique opportunities it posed if done correctly through new investments in building and infrastructure and increased economic activities. One interviewee shared, *“Many people are – rightly – concerned about gentrification, but at least there is interest and activity in Chinatown and conditions are rising. It could have continued on the downward trajectory, being abandoned and forgotten, but instead there is investment and interest, and that’s a better position to be in.”*

Housing Assistance

Across many focus groups and in several key informant interviews, residents noted that the demand for Section 8 and other subsidy programs is much larger than what is available, resulting in very long wait lists. (Section 8 refers to Section 8 of the Housing Act of 1937 and is a public program which authorizes payment rental housing assistance to private landlords on behalf of low-income households.) For example, residents from Roxbury and Dorchester reported instances of being denied housing because landlords did not want to accept Section 8 housing. One shared, *“I’ve been told that I can’t live in certain places because the landlord was no longer renting to Section 8 tenants.”* Other participants in the group agreed and one added, *“Landlords don’t want to [accept] section 8 anymore so they don’t update the apartment because in order to receive Section 8 the place has to be up to code.”* According to multiple key informants and focus group participants, these issues were compounded for residents who are disabled, elderly, or for those with a criminal record.

Those working with older adults expressed concern for seniors on fixed incomes who are not able to remain in their homes and then must face long wait lists for affordable senior housing. One interviewee shared, *“Housing is a big issue for seniors who are retired or disabled. We see retired elders who are not eligible for housing, or if they are, wait lists are more than 5 years long for accessible housing.”* Similarly, a public housing resident from Dorchester explained, *“We have elderly folks who are being displaced because [public] housing units aren’t accessible [for the disabled] and there are no call buttons in case they need help.”*

Overcrowding

The housing cost burden has cascading effects on residents’ home and social environment. Overcrowding, housing instability, and homelessness are a few of the themes that emerged in discussions with focus group and interview participants. For example, focus group participants who identified as low-wage workers explained that in order to make ends meet, it was often a necessity to live in multigenerational households, with roommates, or with multiple families. One focus group participant shared, *“I am trying to get ahead so I work two jobs overnight, but because I can’t afford rent on my own, I have a lot of roommates. You live with too much stress because you’re working too hard, and then you have to come back home to a lot of people who might be noisy or unclean.”* Further, a few key informants described resident requirements imposed on city employees that are increasingly burdensome as the cost of housing becomes more expensive. One interviewee shared, *“I can’t tell you how much I’ve heard of younger city employees having multiple jobs, needing to supplement their income with a second or third job. It’s hard for people, for working families to make ends meet [with these requirements].”*

Overcrowding is defined as more than one person per room living in a housing unit. According to those respondents of the American Community Survey, one in ten residents in East Boston (9.8%) experienced overcrowded housing – a proportion that was triple the average across Boston (3.1%) (Figure 35).

Figure 35. Percent Housing Units Experiencing Overcrowding, by Boston and Neighborhood, 2013–2017

DATA SOURCE: U.S. Census, American Community Survey 5-Year Estimates, 2013–2017

NOTE: Overcrowding is defined as more than one person per room; Neighborhoods as defined by Boston Public Health Commission; Back Bay includes Back Bay, Beacon Hill, Downtown, North End, and West End; South End includes South End and Chinatown; Asterisk denotes where the neighborhood estimate is significantly different compared to the Boston estimate ($p < 0.05$); Error bars show 95% confidence interval; NA denotes where data are suppressed due to insufficient sample size

Housing Discrimination

Housing discrimination was an issue that was discussed in a few focus groups. Specifically, parents of younger children noted that they felt landlords discriminated against families, especially single-parent households. One East Boston resident shared, “*There are owners of houses and the first thing they ask you is whether or not you have kids and how many. If you have kids, they don’t want to rent to you.*” Focus group participants who resided in Allston/Brighton also spoke of challenges finding housing as parents. One explained, “*In this area, it’s very difficult to find apartments because it’s expensive and they ask for so many [requirements] –and they always ask about children too – they don’t like if you have children. It’s difficult to find a nice place and if you find it, the rest is so expensive.*” Other focus group participants who reported experiencing housing discrimination include participants who identified as: those in recovery or actively using, residents with a criminal record, and communities of color.

In 2018, there were 51 discrimination cases relating to housing filed in Boston by Massachusetts Commission Against Discrimination (MCAD), compared to 44 cases filed in Boston in 2017. Among the housing discrimination cases in 2018, six in ten cases were filed based on discrimination against a protected disability status (61%) (Figure 36). Nearly four in ten (39%) housing discrimination cases in 2018 were filed due to discrimination based on race. Approximately one in ten discrimination cases was attributed to public assistance (12%), sex (12%), sexual orientation (12%), age (10%), and retaliation (10%).

Figure 36. Percent Housing Discrimination Cases Filed in Boston (N=51), by Protected Category, 2018

DATA SOURCE: Massachusetts Commission Against Discrimination (MCAD), 2018

NOTES: Data are arranged in descending order; Numbers represent cases filed by the housing jurisdiction in the Boston; Protected category is a characteristic of a person which cannot be targeted for discrimination and can differ based on the type of alleged discrimination - common protected categories include race, gender, gender-identity, ethnicity, age, national origin, sexual orientation, military status and disability; A case can be filed for or involve more than one protected category

Homelessness

Homelessness was discussed as a concern across focus group and key informant geographies, especially with residents who lived in Chinatown, Downtown, and East Boston. Focus group participants from these neighborhoods perceived that homelessness was on the rise and often related those who were homeless with mental health or substance use issues. However, key informants with expertise in housing indicated that homelessness impacts a diverse range of residents across the city regardless of health status, race, or family makeup.

In 2018, there were an estimated 6,188 residents that were counted as homelessness or housing unstable in Boston (Table 8). It should be noted that these data may not account for residents who are temporarily without a permanent address and are staying with friends or in their car. Among those identified, the majority of homeless residents were staying in emergency shelters (5,427 individuals), followed by transitional shelters (598 individuals), and unsheltered housing (163 individuals). Among this homeless population, four in ten homeless residents identified as Black (45.1%), 36.1% as white, and 17.0% as two or more races. More than 35% identified as Latino (any race). Data of counts over time and shelter bed capacity are provided in [APPENDIX I](#).

Table 8. Total Number of Homeless Individuals Living in Boston, by Race, Ethnicity, and Shelter Type, 2018

	Sheltered		Unsheltered	Total	Percent of Total
	Emergency Shelter	Transitional Housing			
American Indian or Alaska Native	13	4	0	17	0.3%
Asian	45	3	5	53	0.9%
Black	2,566	188	36	2,790	45.1%
Native Hawaiian or Other Pacific Islander	38	3	0	41	0.7%
White	1,913	251	70	2,234	36.1%
Multi-race	852	149	52	1,053	17.0%
Total	5,427	598	163	6,188	
Latino	2,079	103	8	2,190	35.4%
Not Latino	3,348	495	155	3,998	64.6%
Total	5,427	598	163	6,188	

DATA SOURCE: U.S. Department of Housing and Urban Development, Continuums of Care, HUD 2018 Continuum of Care Homeless Assistance Programs Homeless Populations and Sub Populations, 2018

NOTE: Safe Haven programs are included in the Transitional Housing category

In 2018, households without children (67%) comprised two-thirds of the homeless population in Boston (Table 9). Three in ten homeless households included at least one adult and one child (31.8%). One percent of homeless households included only children (1%). Emergency shelter was the most common type of shelter for homeless households, followed by transitional housing.

Table 9. Total Number of Homeless Households Living in Boston, by Household Type and Shelter Type, 2018

	Sheltered		Unsheltered	Total	Percent of Total
	Emergency Shelter	Transitional Housing			
Households without children	1,806	407	163	2,376	67.4%
Households with at least one adult and one child	1,075	46	0	1,121	31.8%
Households with only children	28	2	0	30	0.9%
Total	2,909	455	163	3,527	

DATA SOURCE: U.S. Department of Housing and Urban Development, Continuums of Care, HUD 2018 Continuum of Care Homeless Assistance Programs Homeless Populations and Sub Populations, 2018

NOTE: Safe Haven programs are included in the Transitional Housing category

In addition to those with mental illness or substance use, key informants also named the following population groups as vulnerable to being homeless: LGBTQ youth and seniors; immigrants; those with criminal records; and single mothers. Of these groups, LGBTQ youth were identified as being especially vulnerable to becoming homeless, particularly for those who identify as transgender or non-binary. LGBTQ youth in focus groups indicated that this was in part due to family rejection, a lack of emotional supports, or limited resources for those who identified as transgender or non-binary. One transgender focus group participant from Jamaica Plain shared, *“For those of us who are homeless, Boston only has single sex shelters. But where does that leave trans people like me?”* It should be noted that Boston has enacted non-discrimination policies in housing and shelters that prohibit discrimination against transgender or gender-nonconforming persons.²⁷ For example, Boston Public Health Commission is one of the largest shelter providers in New England. Their policy is that transgender guests choose the shelter that corresponds with their gender identity or whichever shelter they feel most comfortable in.

While homelessness was described as impacting diverse groups, the experience of trauma was a reported commonality among them. Several interviews discussed that trauma was a significant challenge to overcoming housing instability. One interviewee illuminated this experience by explaining: *“Many of our [homeless] parents have also suffered from other traumas including childhood traumas, regardless of specific backgrounds (race, culture, community). All parents coming to [homeless shelters] show strong resilience and grit. However, they don’t always have the tools to take them out of the day-to-day crisis; once your life spirals, it can be challenging to get out of that, especially if you’re walking around with trauma on your back.”*

Additionally, some key informants shared the perception that law enforcement is increasingly being asked to intervene with the homeless population, even if they may not be the appropriate first-responders. One interviewee explained, *“Being homeless is not a crime, but when people see homeless individuals, they assume they might be a criminal and call [the police] to remove them from places.”*

However, key informants noted that compared to other cities, Boston has a sophisticated strategy to addressing chronic homelessness by using real-time data to drive priorities and working with a host of partners across sectors including the public health department, the Boston Housing Authority, and nonprofit organizations including Pine Street Inn, Boston Health care for the Homeless, and St. Francis House, among others. One shared, *“The city has a*

common database that everyone who works with homeless people can access called *Efforts to Outcomes*. The city hosts the data and produces a quarterly list of the longest-term stayers (i.e. the chronically homeless), who are then prioritized for housing through a matching system.”

Interviewees in the field discussed that while up-to-date, centralized data are a key first step to addressing chronic homelessness, more resources are needed for newly homeless families or for residents who have been homeless for a year or less. One interviewee explained, “Ironically, people who are homeless but [who are not categorized] as “chronic” have fewer options and limited resources.” There was also the perception that the length of stays in homeless shelters is increasing, partly due to long wait lists for subsidized housing, which was described as straining resources for newly-homeless families. One interviewee explained, “Boston has great shelters in the area that are temporarily housing mothers with young children, but it’s hard because [families] may be in the shelter for up to two years because of the inability to find an apartment that accepts Section 8 vouchers.”

Among ACO MassHealth patients who were screened in Partners Health care and Boston Medical Center primary care settings, 17% were indicated that they were homeless or did not have a steady place to live (Table 10).

Table 10. Boston MassHealth Patients from Partners Health care and Boston Medical Center Screened for Social Needs and Are Homeless

Total Screened	# Homeless	% Homeless
7,886	1,320	17%

DATA SOURCE: Social Needs Screening Data, Partners Health care and Boston Medical Center (BMC), 2018
NOTES: Analyses only among MassHealth ACO primary care patients and Boston residents
Positive screen as homeless for patients who indicated that they do not have housing or do not have a steady place to live (e.g., temporarily staying with others, in a hotel, in a shelter, living outside on the street, on a beach, in a car, abandoned building, bus or train station, or in a park)

Housing Conditions

Housing quality and poor housing conditions were themes discussed in several conversations for this data gathering effort. These key points are explored here, yet a deeper dive discussion on specific indoor environmental exposures and health effects of poor housing quality can be found in the Environmental Health section of this report. Participants across most groups voiced concerns about the old housing stock in the city of Boston, specifically mentioning lead, mold, rodents, and insects as issues in their neighborhoods.

However, specific themes arose in focus groups with residents of particular neighborhoods. Focus group participants from Allston/Brighton reported being generally satisfied with the quality of housing in their neighborhoods, citing universities and health care institutions that have made investments to improve their neighborhood’s living conditions. One resident shared, “Living in Allston is very good because the universities are creating a lot of new buildings and resources for the neighborhood to make it nicer.” On the contrary, focus group residents from Chinatown, Dorchester, and East Boston specifically discussed concerns around housing quality in their neighborhoods, citing housing stock in disrepair, overcrowding, and a lack of investments as key issues. Focus group participants from Mattapan and Dorchester perceived that landlords often “do what they want” including developing additional units within their buildings without notifying residents. One Mattapan resident shared, “My landlord is making

the basement into a 3-bedroom apartment, but they didn't even let us know. I thought construction places are supposed to hold community meetings but they're not, and if they are, if they are making people aware of them." Another focus group participant shared this sentiment and added, *"Some greedy landlords will divide one apartment into multiple tiny units for renters."* Similarly, key informants cited a need for more equitable investments across housing units in Chinatown. One shared, *"There has been a resurgence in the [Chinatown] community over the last eight years. In some cases, buildings where people have lived for a long time have been bought out and/or renovated. But there are also landlords who are not spending the money to keep up their buildings; it would be nice to see more of an investment in these properties."*

Focus group participants who identified as low-income and/or housing insecure indicated that with such high demands for apartments, tenants are less likely to voice concerns of poor housing conditions out of fear of being evicted or losing their home. One East Boston resident shared, *"There are a lot of situations where people are living in housing that is not good and they can't say anything because they are scared to be kicked out."*

Transportation

Why is This Important?

Transportation connects people with and between where they live, learn, play, and work. Transportation can promote health by enabling individuals, families, and communities to access resources and opportunities, including employment, health care, education, and other goods and services (e.g., grocery stores, parks).²⁸ Active forms of transportation, such as walking and cycling, can also be health promoting, reducing the risk of obesity, diabetes, and cardiovascular disease and improving mental health and community cohesion.²⁹ Transportation can also have health consequences, including traffic-related accidents, air pollution exposure, and sedentary lifestyles linked with less active forms of transportation.³⁰

"Most [residents] rely on public transportation and it is difficult when the signs are not in their language. They may not understand announcements about delays or emergencies, and it makes them feel insecure about how to navigate." — Key informant interviewee

Key Findings in this Section

Though many residents who participated in focus groups perceived improvements in transportation in recent years, others expressed concerns about cost, timeliness, and accessibility of public transportation especially for the elderly, those with limited English proficiency, and for residents of neighborhoods who have traditionally had limited access to transportation. Slightly over one-third of Boston residents use a personal vehicle to get to work, and another one-third use public transportation; use of public transportation is particularly high in East Boston and Jamaica Plain. On average, Bostonians spend about 11% of household income on transportation-related expenses. Parking and traffic were mentioned as day-to-day concerns for many community residents. Challenges with public transit and transportation programs, including lack of reliability, difficulty navigating the system, overcrowding, and the need to schedule in advance, can make it difficult to keep medical appointments according to

focus group members and interviewees. Efforts such as Go Boston 2030 and bike share programs were seen as positive steps to address the city's transportation challenges.

Views of Transportation

Residents in focus groups across different neighborhoods shared mixed perceptions about transportation. Some participants reported being generally satisfied with transportation access in their neighborhoods, while others voiced concerns about cost, timeliness, and accessibility for the elderly. For example, focus group participants from Allston/Brighton and Jamaica Plain reported being satisfied with transportation in their neighborhoods, citing close proximity to buses and trains. Focus group participants in Mattapan noted improvements to key Mattapan bus routes in recent years. One participant shared, *"The Commuter Rail just opened a stop at Mattapan near Simco from Hyde Park to Mattapan; it used to be such a headache. There are many buses that goes through there[now]- things have gotten better."* Still, Mattapan was described by focus group participants living in other neighborhoods as a neighborhood that needed improvements to public transportation.

Residents in Chinatown reported being satisfied with the proximity of public transportation options but expressed concern with the cleanliness of bus and train platforms. One resident shared, *"I think the subway and bus system are very convenient. But the subways are so dirty, I can always notice strong urine odor by Chinatown station and Tufts Medical Center station."* Similarly, others spoke about the old infrastructure of the city's public transportation system. As one key informant interviewee noted, *"We have an old transit system that needs a lot of investments in order to maintain what we currently have."* Data show that the Massachusetts Bay Transportation Authority (MBTA) is well-used. According to the Regional Indicators report by the Metropolitan Area Planning Council (MAPC), in 2015, the MBTA experienced an average of approximately 32,966,627 passenger trips per month.³¹

Means of Transportation and Transportation Costs

Across Boston, use of a personal vehicle (39%) was the most common form of transportation to work, followed by public transportation (34%), walking (15%), and carpooling (6%) in 2013-2017. Transportation patterns varied significantly across most Boston neighborhoods. Compared to Boston overall, East Boston (58%), Jamaica Plain (43%), Roxbury (40%), Dorchester (37-38%), South Boston (36%), and Allston/Brighton (35%) had a significantly higher proportion of residents who used public transportation to go to work (see [APPENDIX I](#), for significance testing). West Roxbury (17%), Back Bay (23%), Hyde Park (23%), Charlestown (27%), Roslindale (28%), Fenway (28%), and the South End (28%) had a significantly lower percentage of residents who used public transportation to get to work (Figure 37).

Figure 37. Means of Transportation to Work for Population 16 Years and Over, by Boston and Neighborhood, 2013–2017

DATA SOURCE: U.S. Census, American Community Survey 5-Year Estimates, 2013–2017

NOTE: Neighborhoods as defined by Boston Public Health Commission; Back Bay includes Back Bay, Beacon Hill, Downtown, North End, and West End; South End includes South End and Chinatown

In 2015, 1,056 patients of 14 community health centers across Boston were asked about their means of transit to the health center on the day of their health center visit (Figure 38). The bus was the most common form of transportation for patients who identified as Black (54%), Latino (44%), or Multi-Racial (44%), followed by driving (27%–38%). Among respondents who identified as Asian, half (51%) reported driving to the health center and one-quarter (26%) used the bus to get to the health center. Among respondents who identified as White, driving (40%) was the most common form of transit to the health center, followed by taking the bus (34%) and walking (31%).

Figure 38. Percent Survey Respondents Reported Usual Form of Transit Taken to Health Center, by Race/Ethnicity, 2015

DATA SOURCE: Fair Public Transportation Report: Community Health Center Directors Roundtable, 2015

In 2014, data show that residents in the Boston Metropolitan Statistical Area spent \$9,997 on average on transportation costs, which includes costs relating to vehicles and public transit.³² From FY2001 to FY2014 residents in the Boston Metropolitan Statistical Area spent 11-13% of their household income on transportation (See [APPENDIX I](#)).

Transportation Barriers

Across most focus groups, parking and traffic were mentioned as a day-to-day concern for many community residents. Focus group participants in Dorchester indicated that these problems are compounded during the winter months because of the snow, especially on dead-end streets. According to key informants, rapid development happening across the city is compounding parking issues. As one participant explained, *“The idea that the city would provide more housing without parking is a real challenge, especially as you start thinking of initiatives like dedicated bus lanes.”* Further, ride shares such as Uber and Lyft were described as exacerbating congestion issues. One interviewee shared, *“Uber and Lyft provide more accessibility to transit and is a great resource for disabled residents and seniors. But we see these trips competing with public transit, and we’re seeing more trips happening in peak hours, adding to congestion.”*

Several focus group and interview participants, namely those from Dorchester and Mattapan, noted that seniors struggle with accessing transportation because of mobility issues or because assistance programs are not consistent or timely. For example, senior focus group participants explained often being late or missing medical appointments because transportation assistance was unreliable. Others indicated that it was difficult to coordinate services because of having to book rides multiple days in advance or because the vehicles were inaccessible. One Dorchester resident shared, *“For rides through social services, you have to call 3 days in advance and they are still late. Then when your appointment is done you sit there all day waiting.”* Another resident agreed and added, *“The vans that come to pick up [seniors] are very tall and [we] can’t get into them and it’s frightening.”* Further, a few focus group participants noted concerns of proposed bus routes being cut, sharing, *“An upcoming concern for me is that the MBTA is thinking of cutting some bus lines and it could impact the elderly.”*

Transportation barriers were also identified by those with limited English proficiency, who reported difficulties navigating the transit system. For example, one key informant explained, “Most [residents] rely on public transportation and it is difficult when the signs are not in their language. They may not understand announcements about delays or emergencies, and it makes them feel insecure about how to navigate.” It was noted that these issues were especially challenging for older adults and seniors. Some key informants perceived that gentrification was forcing residents further from social services, which exacerbates the challenges to public transportation. One key informant shared, “[Residents] with mobility issues may be able to take advantage of services like The RIDE from MBTA, but you have to call and request that service, and for Chinese-speaking individuals, that can be a challenge.” A few focus group participants mentioned the recent increases to MBTA fares and the perception that these increases disproportionately impact seniors, low-wage workers, and communities of color.

Reflecting the themes that emerged in focus groups and interviews, 23.1% of Boston CHNA survey respondents cited limited street parking, traffic-related noise, or traffic as a barrier to getting to medical appointments. Nearly one in five (19.2%) of Boston CHNA survey respondents identified the availability of public transportation as a barrier, while one-quarter 15.5% cited the cost of transportation a barrier (Table 11). These top reasons were similar among survey respondents who spoke a language other than English, although Chinese and Vietnamese speakers were significantly more likely to indicate that clear and understandable transportation signs and directions were a transportation barrier.

Table 11. Percent Boston CHNA Survey Respondents Reported Transportation Barriers to Getting to Medical Appointments, Meetings, Work, or Getting Things Needed for Daily Living, By All Respondents and Primary Language, 2019

	All Respondents (N=2,012)	Chinese (N=137)	English (N=1,769)	Haitian Creole (N=55)	Portuguese (N=47)	Spanish (N=362)	Vietnamese (N=82)
Limited street parking, traffic-related noise, or traffic	23.1%	16.1%	23.2%	18.2%	19.2%	25.4%	34.2%
Availability of public transportation	19.2%	15.3%	18.6%	21.8%	21.3%	19.6%	28.1%
Cost of transportation	15.5%	7.3%	14.9%	18.2%	14.9%	23.8%	13.4%
Limited opportunities for safe bicycle riding	8.5%	1.5%	8.5%	3.6%	6.4%	7.7%	4.9%
Clear and understandable transportation signs and directions	4.0%	6.6%	3.7%	3.6%	2.1%	4.4%	9.8%
None of the above	55.8%	66.4%	56.6%	49.1%	61.7%	50.3%	42.7%

DATA SOURCE: Boston CHNA Community Survey, 2019

APPENDIX I shows data for transportation barriers by neighborhoods with large enough sub-sample sizes. Limited street parking, traffic-related noise, or traffic was similarly the most frequently selected barrier among respondents living in Roslindale (26.8%), South End (23.2%), Jamaica Plain (22.7%), Hyde Park (20.2%), Dorchester (24.8%), and East Boston (28.2%). Among those living in Mattapan, respondents were most likely to report the cost of transportation as a barrier (19.8%). In Allston/Brighton and Roxbury communities, respondents most frequently reported the availability of public transportation as a barrier (26.7% and 20.7%, respectively).

Transportation Resources

It was noted by key informants that the city is working towards efforts to address transportation issues through initiatives like Go Boston 2030, a city plan that aims to address Boston's most pressing transportation issues by address long-term inequality, increasing economic mobility, and improving environmental health impacts in the next 5, 10, and 15 years. Interviews reported that while these efforts are a step in a positive direction, more is needed to address transportation equity across the city. One suggestion was to focus on providing faster commutes on buses for lower income communities of color such as Mattapan and Roxbury. An interviewee explained that in high needs areas *"there's a huge opportunity to improve bus service through dedicated lane or queue jumps (a type of roadway geometry used to provide preference to buses at intersections, often found in bus rapid transit systems)."*

Key informants noted the addition of Blue Bikes and protected bike lanes in recent years as initiatives that were alleviating some congestion and accessibility issues; however, they commented that these efforts will need to be bolstered and creative solutions will be needed to address the increasing traffic and parking pressures caused by development. Local solutions to transportation barriers were cited as most effective; one key informant expert suggested that municipalities and towns explore taking a more active role in transportation taxes in order to generate revenue for operational costs at the local level. Lastly, there was a suggestion for larger institutions to take a lead in modeling responsible transportation practices. One interviewee shared, *"I think these big institutions can start helping with their own practices. It's helpful when organizations adopt policies that provide their staff with transportation opportunities."*

Green Space and the Built Environment

Why is This Important?

Over 8% of land in Boston is comprised of parks, playgrounds, and athletic fields.

Green space and the built environment influence the public's health, particularly in relation to chronic diseases. Urban environments and physical spaces can expose people to toxins or pollutants, affecting health conditions such as cancer, lead poisoning, and asthma.³³ There is compelling evidence that changes in environmental policies can have an impact on children and families.³⁴ Physical space influences lifestyles: playgrounds, green spaces, and trails as well as bike lanes and safe sidewalks and crosswalks all encourage physical activity and social interaction, which positively affect physical and mental health.³⁵ Specifically, lower rates of

childhood obesity and decreased levels of stress among adolescents have been associated with safe, accessible green spaces and other built environment elements.³⁶

Key Findings in This Section

Slightly over 8% of land in Boston is comprised of parks, playgrounds, and athletic fields and about 7% is parkways, reservations, and beaches. Boston has a walkability score of 81, indicating a “very walkable” community.³⁷ However, focus group members and interviewees shared that the built environment varies across neighborhoods. Those from Allston/Brighton, Chinatown, and Dorchester perceived insufficient green space across their neighborhoods, which they attributed to the growth in new housing developments. In contrast, interviewees and focus group participants described Jamaica Plain and East Boston as neighborhoods with ample access to green space. Participants also shared additional concerns specific to their neighborhoods, with those from Dorchester, Mattapan, and Chinatown expressing concern about safety in their community open spaces, as well as challenges with rodents, snow removal, and lack of public restrooms.

Green Space

The importance of accessible green space and its relation to health was discussed in multiple focus groups throughout the city. As one focus group participant summarized, *“You need to keep a good environment to maintain a healthy life.”* Focus group participants in Allston/Brighton, Chinatown, and Dorchester perceived a decrease in green space across their neighborhoods and attributed the decline to new housing developments under construction. One focus group participant explained, *“People are cutting the trees for the big buildings. If you take the trees, you find more carbon monoxide, increases in cancer, more stress...you will not find peace in the community anymore.”* A parent from Allston agreed and added *“I’m under the impression that people are forgetting about children [in Allston/Brighton]. How is it that there are more dog parks and not any parks for children?”* Focus group participants in Dorchester, Mattapan, and Chinatown expressed concerns about individual safety in their community open spaces, citing an increase in used needles on sidewalks, playgrounds, and parks. On the contrary, interviewees and focus group participants described Jamaica Plain and East Boston as neighborhoods with ample access to green space. Specific outdoor spaces that were mentioned as community strengths included Piers Park in East Boston, the Arboretum in Jamaica Plain, and Franklin Park in Dorchester.

As noted in the Approximately 49% of Boston’s 47 square miles (excluding Harbor Islands) is zoned residential while approximately 24% is zoned as business, institutional, industrial, or mixed-use. The remaining 27% consists mostly of open space and miscellaneous.

Figure 39 displays the green space and open space in Boston, where 8.3% of land is comprised of parks, playgrounds, and athletic fields and 7.4% is parkways, reservations, and beaches. As noted in Health of Boston 2016-2017 report, approximately 11 square miles of Boston’s 48 square miles (including the Harbor Islands) is open space. Boston also comprises 29 miles of bicycle trails. The largest portions of bicycle trails are in East Boston and Hyde Park (about 6 miles each); however, there is less than 1 mile of bicycle trails in Mattapan and Roslindale.³⁸

Figure 39. General Open Space, by Type and Neighborhood, 2017

DATA SOURCE: City of Boston, Parks and Recreation Department, Boston Open Space, as reported and analyzed by Boston Public Health Commission, Research and Evaluation Office, Health of Boston Report 2016-2017, 2017

Walkability

Walkability in a neighborhood is important for facilitating physical activity, personal safety, and community cohesion. The Walk Score walkability index, ranges from 0 to 100, based on walking routes to local destinations such as grocery stores, parks, schools, and store outlets. Boston is the 3rd most walkable large city with a Walk Score of 81. In 2017, the Walk Score varied widely by zip code in Boston from 57 to 99 (Figure 40). The highest Walk Score was observed in the zip codes associated with North End (99 in 02113) and Back Bay/Bay Village (98 in 02199), while the lowest Walk Score was observed in the zip codes associated with Hyde Park (57 in 02136) and West Roxbury (61 in 02132).

Figure 40: Walk Score, by Zip Code, 2017

DATA SOURCE: Walk Score, www.walkscore.com, as reported and analyzed by Boston Public Health Commission, Research and Evaluation Office, Health of Boston Report 2016-2017, 2017

NOTES: “BB” includes the Back Bay, Beacon Hill, Downtown, North End, and West End; “SE” includes South End and Chinatown; Walk Score is an index of pedestrian-friendliness that ranges from 0 to 100; Data for the portion of zip code 02467 in Boston were unavailable; Map does not include the Harbor Islands

Figure 41 provides a 2014 map of the city and where sidewalks are considered to be in good, fair, or poor condition. Dorchester, Roslindale, and West Roxbury appear to have the largest concentrations of poor condition sidewalks in the city. Since then, the Boston Public Works Department Streetcaster Program has focused first on sidewalk replacements, particularly in those neighborhoods which have historically initiated fewer requests for repairs to assure and innovative and equitable approach to capital resource allocation.

Sidewalk Conditions

- Poor Condition
- Fair Condition
- Good Condition

Esri, HERE, DeLorme, MapmyIndia, © OpenStreetMap contributors, and the GIS user community

NOTES: City Engineers assessed the sidewalks and quantified the amount of damage each sidewalk block had. A sidewalk condition metric was calculated called the "Sidewalk Condition Index" also known as the SCI. This metric is a direct ratio of how "undamaged" the sidewalk area is. Damage can refer to sidewalks that are cracked, faulted due to tree roots, utility cut patches, missing bricks/material, etc. For example, if the engineers quantified 800 square feet of damage in the assessment and the total sidewalk area is 1,000 square feet then the SCI of that block would be a 20 (since 80% is damaged). The SCI scores were grouped into 3 main categories: Good condition was for sidewalks that had a SCI from 80-100, fair condition sidewalks had an SCI between 50 and 80, and the poor condition sidewalks had an SCI less than 50. The reasoning of these condition thresholds is that if the sidewalk is more than half damaged it will be considered "poor" and require full reconstruction since a partial repair isn't sufficient. If the SCI is between 50-80 (fair) then it may be a candidate for partial repair.

Perceptions of the Built Environment and Neighborhood Development

In several focus groups across the city there was a perception that many areas were becoming overcrowded with new developments. One resident from Dorchester shared, *“They build and build until we’re stuffed in like pack rats...every little slot they’re building something; we’re literally living on top of our neighbors.”* These overcrowding concerns were echoed in East Boston and Chinatown, with one resident sharing, *“In the mornings it’s really hard to get around because the construction makes things congested. There needs to be a response soon to everything that is being built.”* A key informant added, *“Chinatown is congested. Elliot Norton Park and Chinatown Park have very small patches of unutilized space, but nothing is there right now. These could be better used if whoever owns these spaces put down some grass and other plants.”* In addition, a few key informants discussed the need for more dedicated bike lanes to mitigate the congestion caused by construction projects.

Focus group participants and interviewees perceived that construction sites throughout the city were adding to the presence of rodents. One resident from Dorchester explained, *“I see a lot of construction, and construction breeds rats.”* Snow removal was also described as a concern by focus group participants in Chinatown, East Boston, and Dorchester. One resident shared, *“I experience many issues during snow season; the city does not clean up all the streets around Chinatown on time and the streets get narrower when people try to park by the meters.”* Further, focus group participants who resided in the South End and in Chinatown reported a lack of public restrooms in their neighborhoods. [APPENDIX I](#) includes data on public restrooms in the city, showing a wide range of availability across neighborhoods.

Social Environment

Why is This Important?

Relationships are important for physical and mental well-being. At an individual level, social networks spread social behaviors: social support can help encourage people engage in more positive healthy behaviors.³⁹ By contrast, lack of connectedness has been shown to be linked to depression and is a risk factor for early mortality.⁴⁰

“Communities have changed so radically over time; the community fabric in terms of [young people] caring for an elder has changed. Just like it takes a village to raise child, it takes a village to raise an elder.” — Key informant interviewee

At the community level, the cohesiveness of a community has been shown to be positively related to self-reported health and mortality.⁴¹ Conversely, discrimination as part of one’s social environment can have a negative impact on health. Structural discrimination such as segregation, inequitable access to quality education, and disparities in incarceration rates can limit opportunities, resources, and well-being of less privileged groups.⁴² Individual discrimination may have high physical and emotional health costs as well. Research suggests that routine discrimination can be a chronic stressor and increase vulnerability to physical illness.^{43,44}

Key Findings in this Section

Focus group members and interviewees pointed to examples of strong social networks in Boston, citing cohesion across different immigrant groups and among others who share similar racial, cultural, linguistic and religious backgrounds. Two-thirds of CHNA community survey respondents believed that people in their neighborhoods help each other and three-quarters perceived that they and their neighbors want the same thing for their neighborhoods. Survey respondents also indicated strong civic engagement, as evidenced by high levels of self-reported involvement in community organizations and voting. At the same time, focus group members also mentioned a decline in community social ties, brought on by lack of time and generational differences. Gentrification has likewise changed the “feel” of some neighborhoods, specifically Roxbury, East Boston, and Dorchester. CHNA community survey results and conversations in focus groups indicate that subtle and overt discrimination is an issue in Boston, particularly for immigrants and non-English speakers, LGBTQ residents, and older residents and youth, substance users and the homeless. Institutional racism was discussed in greater detail as being pervasive across the city given discriminatory policies at a systems level, and is described in more detail in the Violence and Trauma section.

Community Cohesion and Gentrification

Community cohesion refers to community dynamics, such as a shared sense of membership, influence, social integration, and connections among residents. In focus group discussions, participants who belonged to similar affinity groups expressed a strong sense of cohesion among their communities, particularly those with similar racial, cultural, linguistic, and religious backgrounds.

“I grew up here and it’s changed so much; I hardly know anyone in the neighborhood anymore.” — Focus group participant

For example, Haitian residents in Mattapan indicated supporting small businesses run by other Haitian immigrants. Residents in East Boston referenced feeling “*en casa*” with their fellow Latino neighbors; translated to “*make yourself at home*”—the phrase means to extend hospitality and respect to one’s neighbor. In Chinatown, it was noted that there are strong connections between newly arrived immigrants and those who have been here longer. One interviewee shared, “*Parents whose families have benefited from services give back and help advocate for other families and children. They become anchors of the community and encourage others to use resources.*”

While some groups described strong community linkages, others such as public housing residents and lower-income groups described limited connections or interactions with their neighbors. For example, residents from Dorchester shared, “*No one knows each other anymore or talks to each other like they used to years ago. You can live right across the street from somebody and not even know their first name.*” A key informant described this type of insularity happening in South Boston as well, sharing, “*One of the challenges has been to get people from the housing developments to participate in community events and activities. They feel so insular in the developments...*” A few focus group and interviewees attributed these disconnects to lack of time and generational differences. Focus group participants from Chinatown, Mattapan, and Dorchester, for example, perceived the emphasis on community approaches to caring for elders

was not as much of a priority for young people. One key informant summarized, *“Communities have changed so radically over time; the community fabric in terms of [young people] caring for an elder has changed. Just like it takes a village to raise child, it takes a village to raise an elder.”*

Lack of connectedness among seniors in the community was a concern voiced by some participants. Across groups that had experience working with seniors, social isolation was identified as the primary mental health issue for older adults. Participants spoke of co-occurring issues that stemmed from social isolation, the most common being hoarding disorder. One key informant explained, *“You’ll see instances when organizations rally together to clean the home of seniors [who are hoarders]. Then we’ll come back 6 months later, and their conditions are right back where they were and it’s because they haven’t left their house or spoken to anyone in weeks.”*

Some key informants and focus group participants with long-standing roots in historically working-class communities of color like Roxbury, East Boston, and Dorchester described changes in the character and culture of their neighborhoods in recent years. Specifically, it was noted that younger professionals were changing the “feel” of these areas. For example, one Roxbury resident shared, *“I grew up here and it’s changed so much; I hardly know anyone in the neighborhood anymore.”* Focus group participants attributed this lack of community linkages to gentrification and displacement. One key informant shared, *“If you’ve been working with people for decades to clean up their neighborhoods who now cannot afford to live in Boston, that affects all of our work. You have people who for years have worked to get the community safer and cleaner and are now getting priced out...pushed away.”*

When asked about perceptions of community cohesion or connectedness, approximately three-quarters of Boston CHNA survey respondents perceived that they and their neighbors want the same thing for their neighborhood (77%) (Figure 42). While gentrification was a theme that emerged in focus groups, seven in ten Boston CHNA survey respondents indicated that they plan to live in their neighborhood for a long time (73%). Approximately two-thirds (68%) of respondents noted that their neighbors help each other out and more than half (56%) of respondents reported recognizing most people who lived in their neighborhood. Notably, despite reported ties to their neighborhood and neighbors, only approximately one-third (35%) of respondents perceived that they had influence over what their neighborhood is like. Responses to these questions by survey respondents’ neighborhood can be found in [APPENDIX I](#).

Figure 42. Boston CHNA Survey Respondents' Reported Perceptions of Community Cohesion in Their Neighborhood, 2019

DATA SOURCE: Boston CHNA Community Survey, 2019

NOTE: Percentage calculations do not include respondents who responded "not applicable/don't know"

Civic Engagement

Involvement in informal or formal social organizations and activities may reflect social integration in a community and/or residents organizing to address community needs. Forty-six percent of Boston CHNA survey respondents, many of which were recruited to complete the survey through community organizations, reported involvement in an organization such as neighborhood associations, labor unions, immigration and civil rights groups, religious groups, community organizations, or other organizations.

Boston CHNA survey respondents were asked about their civic engagement and connection to civic processes (Figure 43). Nearly nine in ten respondents indicated that it was important to be involved in government decision-making (90%). Eight in ten respondents knew who their elected representatives were (78%). Approximately seven in ten respondents knew how to contact an elected representative (71%) or felt that they could influence decisions made at city, state, and federal levels (65%).

Figure 43. Boston CHNA Survey Respondents' Reported Perceptions Civic Engagement, 2019

DATA SOURCE: Boston CHNA Community Survey, 2019

NOTE: Percentage calculations do not include respondents who responded "not applicable/don't know"

Another form of civic engagement includes voting. As shown in Figure 44, among Boston CHNA survey respondents who are eligible to vote, nearly half (47%) reported voting in every election. One-third (36%) of respondents indicated that they voted in almost every election.

Figure 44. Percent Boston CHNA Survey Respondents Who Are Eligible to Vote Reporting Voting Behaviors (N=1,397), 2019

DATA SOURCE: Boston CHNA Community Survey, 2019

NOTE: Percentage calculations do not include respondents who selected "I am not eligible to vote" and "prefer not to answer/don't know"

Discrimination

Discrimination was mentioned in several focus groups across the city, particularly with immigrants and non-English speakers, LGBTQ residents, substance users, and the homeless population. These experiences were described as both subtle and overt acts felt on a regular basis; examples ranged from verbal altercations to more systemic issues such as people of color being passed up for job promotions despite qualifications. All of these issues were compounded when residents belonged to multiple oppressed identities, for example, queer people of color or non-English speaking residents in recovery. The following sections weave together reports of discrimination based on focus groups and interviews and responses to the Boston CHNA survey.

Boston CHNA survey respondents were asked about their experiences of discrimination in day-to-day life (Figure 45, more detailed data in [APPENDIX I](#)). Nearly half of respondents reported being treated with less courtesy than other people (49%), people acting as if they are better than the respondent (48%), and being treated with less respect (47%) a few times a year or more.

About one in three respondents reported experiencing poorer service than other people at restaurants or stores (29%) and one-quarter reported being called names or insulted (24%) at least a few times a year. Notably, one-third of respondents reported being threatened or harassed (35%) and people acting as if they are afraid of them (30%) in their life time. Over their life course, more than one-quarter of respondents reported receiving poorer service when receiving medical care (28%). These experiences of discrimination are important as they can restrict access to health promoting resources (such as health care), serve as stressful life events, and/or shape future interactions with institutions or spaces where they experienced discrimination.

Figure 45. Boston CHNA Survey Respondents' Reported Perceptions of Discrimination in Day-To-Day Life, 2019

DATA SOURCE: Boston CHNA Community Survey, 2019

Boston CHNA survey respondents who indicated an experience of discrimination at least a few times per year were asked to indicate the main perceived reasons for the experience(s) of

discrimination that they reported (Figure 46). Approximately half of respondents attributed their experience of discrimination to their gender (51%) or race (48%). More than one-third reported age-based discrimination (37%) and one-quarter linked their experience of discrimination with their ancestry or national origins (26%). Approximately one in five respondents reported discrimination based on some other aspect of their physical appearance (21%) or their education or income level (20%).

Figure 46. Percent Boston CHNA Survey Respondents Reporting Their Own Perceived Reasons for Their Experiences of Discrimination If They Reported Experiencing Discrimination a Few Times a Year or More (N=872), 2019

DATA SOURCE: Boston CHNA Community Survey, 2019
NOTES: Data organized in descending order; Respondents were allowed to select multiple responses; therefore, percentages may not sum to 100%; Percentage calculations include respondents who selected “almost every day,” “at least once a week,” “a few times a month,” and “a few times a year” to the previous question on experiences of discrimination; Percentage calculations do not include respondents who selected “prefer not to answer/don’t know”

Table 12 presents the three most frequently reported reasons for experiences of discrimination by race/ethnicity, age, gender, and sexual orientation. Recognizing that respondents may hold multiple social statuses or identities that may be salient in their experiences of discrimination, [APPENDIX I](#) includes additional tables presenting tests of significant differences in reports of discrimination in the past year by respondents’ race/ethnicity, age groups, gender identity, and sexual orientation.

Table 12. Top Three Reported Perceived Reasons for Experiences of Discrimination If They Reported Experiencing Discrimination a Few Times a Year or More, by Selected Indicators, 2019

	Asian (N=91)	Black (N=214)	Latino (N=194)	White (N=302)	Under 18 years (N=92)	65+ years (N=59)	Female (N=660)	LGBTQ (N=238)
1	Race	Race	Race	Gender	Race	Age	Gender	Gender
2	Ancestry or national origins	Gender	Gender	Age	Age	Race	Race	Sexual orientation
3	Gender	Age	Ancestry or national origins	Some other aspect of your physical appearance	Gender	Gender	Age	Race

DATA SOURCE: Boston CHNA Community Survey, 2019

NOTE: Respondents were allowed to select multiple response options; therefore, percentages may not sum to 100%; Percentage calculations include respondents who selected “almost every day,” “at least once a week,” “a few times a month,” and “a few times a year” to the previous question on experiences of discrimination; Percentage calculations do not include respondents who selected “prefer not to answer/don’t know”

LGBTQ Boston CHNA survey respondents (54%) were more likely than heterosexual/non-transgender respondents (3%) to report discrimination based on their sexual orientation. LGBTQ-identifying residents in focus groups discussed being discriminated against based on gender identity, especially among transgender and gender non-conforming youth. For example, focus group participants spoke of experiences where health providers would not address them by their preferred pronoun, citing that it made them feel “*not completely seen by others.*” Other challenges cited by LGBTQ focus group participant included access to reproductive health and hormone therapy.

Interviews and focus group discussions with residents help to illuminate experiences of discrimination similar to those reported in the Boston CHNA survey. Focus group participants who identified as immigrants most commonly described instances of discrimination in public spaces like the supermarket or on public transportation; this was especially true for those who identified as Latino and Asian. One East Boston resident described, “*At the supermarket, I was standing close to an American and accidentally [grazed] him. He looked disgusted when I touched him and wiped his arm off like an animal had touched him. That sticks with you.*” These groups perceived an increase in prejudice or discriminatory behavior in the last few years and attributed these tensions to the current political climate. Being discriminated against because of one’s ability to speak English or because of one’s accent was also a common theme among non-English focus group participants. One resident expressed, “*Even when you try to speak English- they try to humiliate your accent.*”

Discrimination can come in many different forms and be perpetrated by different types of people and institutions. Some focus group participants of color specifically described instances of *within-group* discrimination, a phenomenon where factions of a single group develop conflicts against each other as by-products of competition and prejudice. Residents in East Boston, Allston/Brighton, and Dorchester, for example, described instances feeling “*othered by their own kind*”. This sentiment was illustrated by examples of employers underpaying Latino residents or landlords inflating rent for residents who were not White. One shared, “*They*

[employers] pay Americans \$26 an hour for work but if you're Latino, they only pay you \$10 because they know you won't report it." There were some mentions of experiences with discrimination among other racial minority groups. Specifically, residents in Dorchester reported negative interactions between Black and non-Black minority groups. Focus group participants in Dorchester and Mattapan also described tensions within the Black community between African Americans and those of African or Caribbean decent.

While the experiences of discrimination against homeless residents did not explicitly emerge in the Boston CHNA survey, focus group participants who were homeless described being treated poorly because of their appearance. One homeless resident shared, *"Hospitals don't treat you the same when you're homeless; they treat you really badly. If you come in you're treated badly by everyone- the security, the nurses, the doctors."* Homeless individuals were often associated with substance users, though some key informants explained that this is not necessarily always accurate; that some residents are just one emergency away from becoming homeless.

Lastly, focus group participants who identified as active substance users described being discriminated against in public spaces and at social service agencies. Some described frequently being judged by other drug users, specifically those who used pills versus heroine or methamphetamine. One focus groups participant shared, *"One of the hardest things is people walking around with their false sobriety. People who aren't using heroin but they're on pills and they're looking down on people. You're either sober or you're not sober."*

A more detailed description of experiences and perceptions of institutional racism and discriminatory policies at a systems level can be found in the Violence and Trauma section.

Community Assets and Resources

Why is This Important?

Understanding the resources and services available in a community—as well as their distribution—helps to elucidate the assets that can be drawn upon to address community health, as well as any gaps that might exist. These assets include both institutions as well as community member characteristics.

Key Findings in This Section

Boston communities have numerous strengths according to focus group members, interviewees, and community survey respondents. Neighborhoods were described as being “tight-knit” with substantial cultural diversity and strong faith communities. Sixty-eight percent of community survey respondents identified racial and cultural diversity as a top strength of their community. Activism and resiliency are other notable characteristics of Bostonians. The city’s colleges and universities are world class.

“Regardless of the changing face of the community, there is still a real sense of community here. People looking out for each other...and the amount of services and variety of services is just incredible. We hope to keep that richness within the community.” — Focus group participant

Proximity and abundance of health care is also a key strength. Across the city, there are 22 hospitals and 33 health center access sites. Community survey respondents identified proximity to medical services as the top strength of their communities, with 69% of respondents identifying this a top strength. Other assets include services and supports for students at Boston Public Schools, and positive strides in the city for LGBTQ residents, including within the school system through Gay Straight Alliances. Finally, the social services network in Boston was perceived to be large, strong, and collaborative, although some suggested more could be done to enhance cooperation across institutions and reduce duplication.

Perceptions of Community Strengths and Assets

When asked about community strengths, participants identified several assets including cultural diversity, collaborative social service organizations, and engaged community residents, among others. Many residents indicated belonging to a strong faith-based community that provides emotional and tangible supports for those who have unmet needs. Key informants who worked with children described an “*incredible resilience*” among children who have experienced trauma.

Proximity to health care services and educational institutions were also described as assets among focus group and interview participants. One focus group participant in Mattapan noted, “*There’s so much that the city of Boston has to offer; it has some of the best colleges and universities, best teaching hospitals and traveling [health care].*” Similarly, residents in Chinatown described the close proximity to services as a strength in their neighborhood. One key informant shared, “*One of Chinatown’s greatest strengths is that you have access to almost everything you need. You can go to restaurants, you can buy groceries, you can access services, you can get health care. As long as you know what you are looking for, you likely are able to find it in Chinatown.*” Jamaica Plain was described as a neighborhood with ample green space, local business, and accessible transportation. One resident shared, “*In JP we are very lucky to have the pond and the Arboretum. There is good transportation and not a lot of fast food restaurants around. People are able to access primary care services without having to go too far...the neighborhood has a lot going for it.*”

Diversity and multiculturalism were seen as strengths across the city. Focus group and interview participants described their communities as “tight-knit”. Participants described an engaged community that is willing to help those who are struggling. One focus group participant shared, “*Regardless of the changing face of the community, there is still a real sense of community here. People looking out for each other...and the amount of services and variety of services is just incredible. We hope to keep that richness within the community.*” Another key informant echoed this sentiment and shared, “*Every community in Boston has profound assets. We have a strong history of activism, strong connections to diverse communities and cultures, and close proximity to leading researchers and thinkers.*” Focus group and interview participants described the strong work ethic and “*will to survive*” as a strength in immigrant communities. Neighborhoods like Chinatown were noted as a strong cultural hub by key informants, with one sharing, “*The Chinatown Gate now has an inclusive and well-maintained park, and many tourists from all over the world come to take photos at the Gate; it’s become a tourist attraction for a lot of people.*” Residents who identified as LGBTQ indicated that Boston is making positive strides related to care for LGTBQ residents and cited Fenway Health and the Justice Resource Institute as strengths.

Survey data reinforce many of these themes from qualitative discussions. When Boston CHNA survey respondents were asked to mark the biggest strengths in their community, a majority of respondents noted “my community is close to medical services” (69.0%), “my community has people of many races and cultures” (67.5%), “people speak my language” (54.8%), and “my community has good access to resources” (54.6%) (Figure 47). Table 13 provides the breakdown of the top five strengths noted among respondents by neighborhood, while Table 14 provides data on this same question by primary language spoken by survey respondent.

Services and Organizational Resources

Survey, focus group, and interview participants all noted proximity and abundance to health care services were major strengths of their community. Health care is the largest industry in Boston, and, as Figure 48 shows, there are 22 hospitals and 33 health center access sites in Boston, including 16 federally qualified health center organizations (with 28 sites as some have more than one location) and 5 hospital-licensed health center organizations. See [APPENDIX I](#) for number of hospitals and health centers by neighborhood.

Figure 48. Hospitals and Community Health Centers in Boston, by Neighborhood, 2019

DATA SOURCES: American Hospital Directory, <https://www.ahd.com>, 2019; Massachusetts League of Community Health Centers, <http://www.massleague.org/>, 2019

NOTES: Neighborhoods as defined by Boston Public Health Commission; Back Bay includes Back Bay, Beacon Hill, Downtown, North End, and West End; South End includes South End and Chinatown

As noted, focus group participants who identified as LGBTQ indicated that Boston is making positive strides related to care for LGTBQ residents. Specifically, BPS has made many inroads in this area for LGBTQ students. In the 2017-2018 school year, out of 74 BPS schools with grades 6-12 who responded to the School Health Profiles survey, 33 BPS schools reported there were Gay Straight Alliances (GSA) in the schools.⁴⁵

Additionally, BPS offers various services and supports for different sub-populations, as reported in the School Health Profiles survey. As shown in Table 15, more than three-quarters of BPS schools offer additional supports for students experiencing trauma, students experiencing homelessness, and English Language Learners.

Table 15. Number of and Percent Boston Public Schools Offering Additional Supports for Sub-Populations, by Sub-Population, 2018

	Number	Percent
Expectant and parenting students	30	42.3%
Refugee, asylee, documented and undocumented immigrant students	63	56.3%
LGBTQ students	69	61.1%
Court-involved students	75	65.2%
ELL students and ELL students with disabilities	99	83.2%
Students experiencing homelessness	105	89.0%
Students experiencing trauma	110	94.0%

DATA SOURCE: Boston Public Schools, Health and Wellness Department, School Health Profiles Survey, 2018

Many focus group and interview participants, particularly those working for a variety of organizations across the city, described the city of Boston as having a strong network of social services with strong partnerships and collaborations. One key informant described, *“Generally Boston is deeply collaborative; even though there isn’t a plan, there is a willingness and appetite to collaborate and pull together in ways that affect the common good.”* However, there is still a need to reduce duplicative services and strengthen collaborations. One key informant summarized, *“Community connectedness matters. The more we are talking to each other, the more success we’re going to have.”* Another interviewee echoed this sentiment and added, *“It can feel like an inundation of services that makes people feel disengaged. Instead we should combine services or be better partners.”* An important next step, suggested key informants, is to fix infrastructure challenges around data sharing. This includes strengthening data repositories to interact across systems and tracking health and environmental data.

COMMUNITY HEALTH ISSUES – WHAT IS THE HEALTH STATUS OF BOSTON RESIDENTS?

Community Perceptions of Health

Why is This Important?

Understanding the health issues that community residents perceive as pressing is a critical step in the CHNA process, providing a “real life” perspective lived experiences, challenges, and facilitators around certain issues that complements more quantitative data about health status and conditions. Although not statistically representative, a community member survey such as was conducted for this CHNA is a useful way to obtain directional information from a large number of people. It also fills in gaps on specific topic areas or population groups where limited secondary data are available. Finally, understanding what community members see as important can be a first step to garnering the buy-in to programs and services that can be most effective in addressing those needs.

Key Findings in this Section

Understanding residents’ perceptions of health is a critical step in the CHNA process, providing insights into lived experiences, including key health concerns and facilitators and barriers to addressing health conditions. The top community health concerns among Boston CHNA survey respondents were housing quality or affordability (51%) and alcohol/drug abuse (49%), followed by mental health (42%) and community violence (31%); these were also top concerns by neighborhood, race/ethnicity, age group, gender, and sexual orientation, with the addition of chronic diseases and related behaviors as well as the environment. However, there were some notable statistically significant differences by race/ethnicity and age. Asian respondents were more likely to identify smoking (37%) and elder/aging health issues (32%), Black respondents were more likely to identify diabetes (35%), Latino respondents were more likely to identify obesity (37%), and White respondents were more likely to identify the environment (39%) as one of their top five community health concerns, when compared to other groups. Youth (under 18 years) were more likely to indicate smoking (42%) and employment/job opportunities (32%) as top concerns relative to other age groups. For young adults (18-24 years) issues such as hunger/food insecurity (30%) and homelessness (29%) also rose to the top. Respondents 65 years of age and older were significantly more likely to indicate as concerns: elder/aging health issues (50%) and the environment (38%) compared to younger age groups. Boston CHNA survey results align with themes that emerged from interviews and focus groups; when asked about top health concerns participants also identified mental health and substance use, trauma, community violence, chronic diseases like asthma and obesity, healthy aging, and environmental health concerns.

Perceptions of a Healthy Community

When asked about top health concerns in Boston, focus group participants and interviewees identified mental health and substance use, trauma, community violence, chronic diseases like asthma and obesity, healthy aging, and environmental health concerns as especially concerning.

As discussed in previous sections, key informants described a need for more emphasis on prevention to address these issues. The lack of providers and services—especially that meet the needs of diverse population groups—was noted as a barrier to addressing some of these issues which contribute to extensive wait lists according to participants.

As shown in Figure 49, access to health care (65%) and affordable housing (64%) were the first and second leading factors, respectively, that Boston CHNA Survey respondents identified as important for a healthy community. Access to public transportation (52%) and access to healthy food (51%) emerged as the third and fourth leading factors that respondents characterized as important for a healthy community.

When looking at definitions of a healthy community across Boston neighborhoods (Table 16), respondents in Chinatown and Hyde Park were more likely to endorse several factors as important for community health. The majority of respondents in Chinatown (82%), East Boston (73%), and Roxbury (72%) identified access to health care as important for community health. Respondents in Chinatown (72%), Jamaica Plain (73%), and Roxbury (75%) cited affordable housing as an area of importance. Reflecting findings from focus groups (discussed in the Transportation chapter), a clean environment stood out amongst respondents in Chinatown (43%). Healthy behaviors and lifestyles were a priority in the South End (28%). Relative to other neighborhoods, a greater proportion of respondents from Hyde Park cited good roads/infrastructure (21%), low level of child abuse (11%), and strong sense of community (24%). Nearly half of respondents in Hyde Park (57%) and Chinatown (49%) cited low crime and violence as important.

Priority Community Health Concerns

When asked to identify the top most important concerns in their community or neighborhood that shape their community's health, housing quality or affordability (51%) and alcohol/drug abuse (49%) were the top priorities, followed by mental health (42%) and community violence (31%) (Figure 50). Approximately one-quarter of respondents cited the environment (28%), obesity (25%), homelessness (24%), smoking (23%), poverty (23%), and diabetes (23%), employment/job opportunities (22%), and elder/aging health issues (22%) as among the leading concerns.

Presented in Table 17 are priority community health concerns that emerged across neighborhoods. Alcohol/drug abuse was the leading concern for respondents in Dorchester, East Boston, Roxbury, and the South End, and was among the top five concerns for respondents in other neighborhoods including Hyde Park and Jamaica Plain. Community violence was the leading concern in Mattapan and was among the top five concerns for respondents in other neighborhoods. Housing quality/affordability emerged as the leading concern in Allston/Brighton, Hyde Park, Jamaica Plain, and Roslindale. Homelessness was among the top five priorities in Dorchester, Roxbury, and the South End. The leading concern for respondents in Chinatown was smoking, followed by chronic conditions. In Allston/Brighton and Roslindale, employment and job opportunities were among the top five priorities for respondents. Hunger and food insecurity were among the top five concerns for residents of Roslindale. In Hyde Park, the health of elders and aging-related concerns was among the top five concerns. Other priority areas that emerged in multiple neighborhoods included mental health, diabetes, and the environment. Additional data by neighborhood can be found in [APPENDIX I](#).

DATA SOURCE: Boston CHNA Community Survey, 2019

When looking at priority community health concerns by various sub-populations, there were both similarities and differences across the sub-populations (Table 18). For several sub-populations, housing quality or affordability, alcohol/drug abuse, and mental health were among the most frequently selected concerns in their neighborhoods. For Asian respondents, smoking was most frequently selected as a concern in their community, and similarly for under 18 respondents, smoking was the second most frequently selected concern.

Table 19 shows the top five respondents' reported concerns affecting the health of their community by primary language spoken. Consistent with what was seen for the aforementioned sub-populations, housing quality or affordability and alcohol/drug abuse rose up as the top concerns in communities when looking across primary languages spoken. Among Chinese speaking respondents; however, smoking and heart disease/stroke were identified as the top two concerns affecting the health of their communities.

Overall Morbidity and Mortality

Why is This Important?

Understanding disease and mortality patterns in a population. Death rates help to measure the burden and impact of disease on a population.⁴⁶ Premature mortality data provide a picture of preventable deaths and point to areas where additional health and public health interventions may be warranted. Life expectancy at birth measures health status across all age groups and shifts in life expectancy are often used to describe trends in mortality.⁴⁷

Key Findings in This Section

Cancer and heart disease continued to be the top two leading causes of death in Boston. Accidents was third, where unintentional overdoses accounted for 55% of all deaths due to accidents. For premature death—death among those under 65 years old—accidents were the leading cause of premature death for Whites and Latino residents, with unintentional opioid overdoses accounting for 70.2% of all deaths due to accidents for Latino residents and 76.7% of all deaths due to accidents for White residents. Homicide was one of the top five leading causes of premature death for Black and Latino residents, while suicide was in the top five leading causes of premature death for White and Asian residents.

Leading Causes of Death and Premature Death

Cancer and heart disease were the leading causes of death in Boston and have remained so for the last six years (Table 20). In the most recent years, accidents, which include drug overdoses, has been the third leading cause of death. In 2016, unintentional opioid overdoses accounted for 55.3% of all deaths due to accidents. Other leading causes of death in the top five are cerebrovascular diseases which includes stroke, and chronic lower respiratory diseases which includes conditions such as chronic obstructive pulmonary disease (COPD) and emphysema complete the top five leading causes of death.

Table 20. Leading Causes of Mortality in Boston, Age-Adjusted Rate per 100,000 Residents, 2011–2016

	2011	2012	2013	2014	2015	2016

DATA SOURCE: Massachusetts Department of Public Health, Massachusetts Death Files, 2011–2016

DATA ANALYSIS: Boston Public Health Commission, Research and Evaluation Office

While cancer and heart disease were the leading cause of death for residents of all races/ethnicities, the leading causes of death for after these two conditions varied for different groups (Table 21). For Asian residents, cerebrovascular diseases, Alzheimer's Disease, and hypertension/renal disease round out the top five leading causes of death. For Black, Latino, and White residents, accidents were the third leading cause of death, with unintentional opioid overdoses accounting for a large part of these deaths (40.9% of all deaths due to accidents for Black residents, 66.7% for Latino residents, and 57.2% for White residents). For Black and Latino residents, diabetes was one of the top five leading causes of death.

DATA SOURCE: Massachusetts Department of Public Health, Massachusetts Death Files, 2014–2016 Combined

DATA ANALYSIS: Boston Public Health Commission, Research and Evaluation Office

When examining leading causes of premature death—death before age 65—cancer has been the leading cause of death from 2011–2016 (Table 22). Heart disease was the second leading cause of premature death from 2011–2013 and fell to third after 2013, while accidents has become the second leading cause of premature death. In 2016, unintentional opioid overdoses accounted for 69.3% of all premature deaths due to accidents in 2016. Suicide and homicide were also in the top five leading causes of premature death in 2016.

Table 22. Leading Causes of Premature Mortality in Boston, Age-Adjusted Rate per 100,000 Residents, 2011-2016

	2011	2012	2013	2014	2015	2016

DATA SOURCE: Massachusetts Department of Public Health, Massachusetts Death Files, 2011-2016

DATA ANALYSIS: Boston Public Health Commission, Research and Evaluation Office

Among Latino and White residents, accidents were the leading cause of premature death in 2014-2016 (Table 23), with unintentional opioid overdoses accounting for 70.2% of all deaths due to accidents for Latino residents and 76.7% of all deaths due to accidents for White residents. For White and Asian residents, suicide was the fourth leading cause of premature death, while it was homicide for Black and Latino residents.

Table 23. Leading Causes of Premature Mortality in Boston, by Race/Ethnicity, Age-Adjusted Rate per 100,000 Residents, 2014-2016 Combined

	Asian	Black	Latino	White

DATA SOURCE: Massachusetts Department of Public Health, Massachusetts Death Files, 2014-2016 Combined

DATA ANALYSIS: Boston Public Health Commission, Research and Evaluation Office

NOTE: NA indicates insufficient number of records for analysis; Mortality rates due to heart disease, accidents, and suicide for Asian residents and the mortality rate due to chronic liver disease and cirrhosis for Latino residents were based on 20 or fewer cases and should be interpreted with caution

Table 24 presents the leading causes of premature death for men and women in Boston, 2014-2016. For men, the death rate by accidents, their leading cause of premature death, was 2 ½ times that for women. However, for both sexes, unintentional opioid overdoses accounted for approximately 70% of the deaths due to accidents. Heart disease was the third leading cause of premature death for both men and women. However, for men, homicide and suicide were the

fourth and fifth leading causes of premature death, while for women it was chronic lower respiratory diseases and cerebrovascular diseases. Premature mortality rates by neighborhood can be found in [APPENDIX I](#).

Obesity, Nutrition, and Physical Activity

Why is This Important?

“When your kid is hungry, it’s much cheaper to buy a soda and a bag of chips than buy some fruit. There’s a huge difference in paying almost \$10 for berries versus \$3 for a soda and large bag of chips that’ll fill you.” — Key informant interviewee

Given that cancer and heart disease are the leading causes of death in Boston and the U.S., it is critical to examine the pervasiveness of their risk factors, such as obesity, nutrition, and physical activity. Obesity is the second leading cause of preventable death in the United States; currently, about 40% of American adults and 19% of American youth are considered obese.⁴⁸ Adults who are obese are at increased risk of morbidity from heart disease, stroke, type 2 diabetes, and certain types of cancer.⁴⁹ Children who are obese are more likely to have high blood pressure and high cholesterol, type 2 diabetes, asthma and sleep apnea, and suffer from psychological problems such as anxiety and depression.⁵⁰ The causes of obesity are several and largely preventable including eating healthy food and engaging in physical activity, as well as limiting screen time. Community environment such as availability of healthy food and opportunities for fitness are critical factors – and lack of these resources at the neighborhood and population level follow similar patterns by race, ethnicity, and socioeconomic status to the inequities seen across nearly all other topics.

Key Findings in This Section

Concerns related to obesity were frequently discussed among focus group and interview participants. More than half of Boston adults and one-third of Boston Public high school students reported being overweight or obese; Black and Latino adults and high school students were more likely to be overweight or obese than White residents or students. The prevalence of obesity and overweight also follows a socioeconomic gradient; residents who are renters, have lower levels of education, and lower income, were more likely to be obese or overweight compared to their counterparts. Neighborhood level obesity rates also are patterned by racial composition and socioeconomic status in most instances. Mattapan, Hyde Park, Dorchester, West Roxbury, East Boston, and Roslindale have significantly greater proportions of adults who are obese or overweight compared to the rest of Boston.

Obesity and Overweight

Issues related to overweight and obesity and food insecurity are intertwined, coupled with the racial and economic inequities that are the drivers for the health disparities seen in the data. Focus group and interview participants discussed these issues as they cited concerns related to affordable and accessible food options for healthy eating and safe open green spaces for exercise, which they viewed as barriers to combating obesity.

Childhood obesity was a common theme that emerged among focus group and interview discussions, who linked challenges related to healthy eating with socioeconomic status. Concerns about childhood obesity were especially prominent in focus groups with immigrant parents and with low-income residents from Dorchester. Parents in these groups described challenges affording and accessing healthy food, time constraints, and economic challenges that create barriers for them to provide healthy opportunities for their children. One interviewee shared, *“When your kid is hungry, it’s much cheaper to buy a soda and a bag of chips than buy some fruit. There’s a huge difference in paying almost \$10 for berries versus \$3 for a soda and large bag of chips that’ll fill you.”* Other key informants perceived that limited physical activity and increased screen time is exacerbating the issue. One shared, *“When you look at the full picture around obesity it makes sense. You have kids spending the majority of their time in front of a screen, less investments in physical education and health classes, and finally poor eating.”* School nutrition was mentioned in one focus; participants in Dorchester perceived that public schools were making positive efforts to enhance nutritional food and provide prevention resources to communities; however, more is needed during school breaks and the summer time.

As shown in Figure 51, more than half (57%) of adults across Boston reported being classified as obese or overweight in 2013-2017. Data in [APPENDIX I](#) indicate that the percent of adults who are obese or overweight has remained steady over the last several years. However, rates are different by various population groups. Nearly seven in ten Black (68%) and Latino (68%) adults reported being obese or overweight compared with five in ten White (51%) adults across Boston (a statistically significant difference). One-third of Asian adults (34%) reported being obese or overweight, significantly lower than the prevalence for White adults (51%). The prevalence of obesity and overweight also follows a socioeconomic gradient, with a significantly higher percent of renters (53%-68%), residents with lower levels of educational attainment (61%-70%), residents with lower income (54%-62%), residents out of work (63%) being obese or overweight compared to their counterparts.

Figure 51. Percent Adults Reporting Obesity or Overweight, by Boston and Selected Indicators, 2013, 2015, and 2017 Combined

DATA SOURCE: Boston Public Health Commission, Boston Behavioral Risk Factor Surveillance System, 2013, 2015, and 2017 combined

DATA ANALYSIS: Boston Public Health Commission, Research and Evaluation Office

NOTES: Bars with pattern indicate reference group for its specific category; Asterisk (*) denotes where estimate was significantly different compared to reference group within specific category ($p < 0.05$); Error bars show 95% confidence interval

At the neighborhood level, the percent of adults in Mattapan (71%), Hyde Park (65%), Dorchester (63-65%), West Roxbury (64%), East Boston (63%), Roslindale (63%) who were obese or overweight was significantly higher than the rest of Boston (Figure 52).

Figure 52. Percent Adults Reporting Obesity or Overweight, by Boston and Neighborhood, 2013, 2015, and 2017 Combined

DATA SOURCE: Boston Public Health Commission, Boston Behavioral Risk Factor Surveillance System, 2013, 2015, and 2017 combined
DATA ANALYSIS: Boston Public Health Commission, Research and Evaluation Office
NOTE: Asterisk (*) denotes where neighborhood estimate was significantly different compared to the rest of Boston ($p < 0.05$); Error bars show 95% confidence interval

Nearly one-third of Boston high school youth (33%) reported being obese or overweight in 2013-2017 (Figure 53). Rates have stayed steady over time, data which can be found in [APPENDIX I](#). Similar to patterns for adults, a significantly higher proportion of Latino (37%) and Black (36%) high school youth reported being obese or overweight than White high school youth (23%). Racial/ethnic differences in the prevalence of obesity or overweight were similar for males and females. More than one-third of LGBTQ (38%) youth reported being obese or overweight, a proportion that was significantly higher than that of heterosexual or non-transgender youth (32%). These trends reflect those seen at the national level for LGBTQ youth.

DATA ANALYSIS: Boston Public Health Commission, Research and Evaluation Office

NOTE: Bars with pattern indicate reference group for its specific category; Asterisk (*) denotes where estimate was significantly different compared to reference group within specific category ($p < 0.05$); Error bars show 95% confidence interval

Physical Activity

Limited access to affordable opportunities for physical activity was a common theme in discussions with residents. As one focus group parent shared, “*Not everyone is able to afford a \$150 for a camp during school vacation.*” Community resources such as the YMCA and Boys and Girls Club were identified as inaccessible to many due to cost. One resident from Dorchester explained, “*The only gym by me is the YMCA, but that is now \$30 a month. Who has an extra \$30 a month? They say they do it by your income but there’s no way I can afford that.*” Seniors also expressed challenges affording these resources. One shared, “*I tried to keep up with my monthly fee at the Y but I just can’t afford it anymore.*” Focus group participants in Chinatown and Dorchester suggested investing in fitness installations in public spaces such as parks and community centers.

Reflecting residents’ concerns, a low percent of youth across Boston reported regular exercise. Three in ten (30%) Boston high school youth reported engaging in regular physical activity in 2013-2017 (Figure 54). Among female high school youth, less than one quarter of Asian (17%), Latina (21%), and Black (22%) students engaged in regular physical activity, significantly lower than the percent reported among White female youth (37%). One-quarter of Asian male high school youth (28%) reported engaging in regular physical activity, which was significantly lower than 44% reported by White male high school youth reporting in engaging in physical activity. About one in five high school youth who identified as LGBTQ (21%) reported regular

physical activity, a proportion that was significantly lower than that of heterosexual and non-transgender students (31%).

Figure 54. Percent Boston Public High School Youth Reporting Engagement in Regular Physical Activity, by Boston and Selected Indicators, 2013, 2015, and 2017 Combined

DATA ANALYSIS: Boston Public Health Commission, Research and Evaluation Office

NOTE: Regular physical activity is defined as at least 60 minutes per day for at least 5 of the past 7 days; Bars with pattern indicate reference group for its specific category; Asterisk (*) denotes where estimate was significantly different compared to reference group within specific category ($p < 0.05$); Error bars show 95% confidence interval

Healthy Eating

In 2013-2015, four in ten (39%) Boston adults reported consuming less than one fruit per day (Figure 55). A significantly higher proportion of adults who were Black (44%), Latino (46%), male (42%), renters (42%-48%), and younger (18-34 years of age; 47%) reported not consuming fruit on a daily basis compared to their counterparts. As with patterns for obesity and overweight, adults with lower socioeconomic status were more likely report fruit consumption on a less than daily basis.

Figure 55. Percent Adults Reporting Fruit Consumption of Less Than Once per Day, by Boston and Selected Indicators, 2013 and 2015 Combined

NOTES: Bars with pattern indicate reference group for its specific category; Asterisk (*) denotes where estimate was significantly different compared to reference group within specific category ($p < 0.05$); Error bars show 95% confidence interval

As shown in Figure 56, one-quarter (25%) of adults across Boston reported less than daily vegetable intake in 2013-2015, combined. Adults who identified as Black (33%), Latino (29%), male (28%), adults 35-49 and 50-64 years of age (21-25%), renters (25%-34%), having less than a college education (35-37%), and immigrants living in the US for less than 10 years (29%) were significantly more likely than their counterparts to report consuming vegetables less than daily.

Figure 56. Percent Adults Reporting Vegetable Consumption of Less Than Once per Day, by Boston and Selected Indicators, 2013 and 2015 Combined

More than four in ten (45%) Boston public high school students reported consuming fruit on a less than daily basis in 2013-2017 (Figure 57). Among female high school students, a significantly higher proportion of Latina (52%), Black (50%), and Asian (45%) female students reported less than daily fruit consumption than White female students (35%). Among male high school students, Latino male students (46%) were significantly more likely than White male students (38%) to consume fruit on a less than daily basis.

Figure 57. Percent Boston Public High School Youth Reporting Fruit Consumption Less Than Once per Day, by Boston and Selected Indicators, 2013, 2015, and 2017 Combined

Half (50%) of Boston Public High School students reported consuming vegetables on a less than daily basis in 2013-2017 (Figure 58). When looking at patterns by race/ethnicity and gender, a significantly high proportion of Latina/o (59% and 54%) and Black (57% and 52%) female and male students, respectively, ate vegetables less than daily compared to 31% of White female students and 40% of White male students.

Figure 58. Percent Boston Public High School Youth Reporting Vegetable Consumption Less Than Once per Day, by Boston and Selected Indicators, 2013, 2015, and 2017 Combined

NOTE: Bars with pattern indicate reference group for its specific category; Asterisk (*) denotes where estimate was significantly different compared to reference group within specific category ($p < 0.05$); Error bars show 95% confidence interval

A few key informants and focus group participants mentioned concerns related to obesity in immigrant communities. Interviewees perceived an increase in obesity among immigrants and attributed the concerns to American diets, citing easy access to fast food restaurants and processed foods. One interviewee explained, “*Coming from a country with undernutrition, the change in diet impacts obesity.*”

Approximately one in seven Boston CHNA survey respondents reported sometimes choosing fast food because it was cheaper (16%). As shown in Figure 59, the percent of residents who indicated that they chose fast food because it was cheaper appeared to vary by language use. Three in ten (31%) respondents who primarily spoke Haitian Creole reported selecting fast food on a weekly basis because it was cheaper, followed by two in ten residents who spoke primarily Vietnamese (24%) and Spanish (20%). However, these figures should be interpreted with caution given the small sample sizes for some groups.

Figure 59. Percent Boston CHNA Survey Respondents Reporting They Chose Fast Food Because It Was Cheaper Than Other Options At Least Once Per Week in Past Month, by All Respondents and Primary Language Spoken, 2019

DATA SOURCE: Boston CHNA Community Survey, 2019

NOTES: Question was worded: “In the past month, how often did you choose fast food (such as McDonalds, KFC, or Wendy’s) because it was cheaper than other options?”; response options: never/rarely, 1-3 times per month (less than once a week), 1-2 times per week, 3-4 times per week, 5-6 times per week, 1+ times per day, and prefer not to answer; Percentage calculations do not include respondents who selected “prefer not to answer”; there were statistically significant differences for the following primary languages spoken when compared to the rest of the survey sample ($p < 0.05$): Haitian Creole, Spanish, and Vietnamese

Food and Physical Activity Access

Focus group and interview participants expressed concern about limited healthy food options in lower income neighborhoods across the city—particularly in Dorchester, Mattapan, and Roxbury. The higher cost of fresh produce and lack of time for healthy food preparation were identified as barriers to healthy eating. One Dorchester resident shared, “*Buying cheap food is not good for your kids but I can’t afford Whole Foods.*” Similarly, another resident who identified as low income summarized, “*People work so many jobs that it’s very difficult to cook. There’s no time so you just work to eat any kind of junk food.*”

Some residents in focus groups described a prevalence of convenient stores and fast food restaurants in low-income communities, which many linked to the rise of obesity and diabetes. One parent from Dorchester shared, “*In our neighborhood we have a lot of corner stores full of a bunch of junk foods. If you go to fruit and veggie areas in corner stores...those fruits have often been sitting there a long time and have fruit flies. If you can’t make it out to South Bay or Grove Hall, that’s what your healthy options are.*” Further, focus group participants from these communities perceived that their neighborhoods had lower quality food compared to more affluent areas of the city. One resident shared, “*The problem is that you can’t get quality food unless you leave your community. It feels like the food in our supermarkets [in Dorchester] is what the other stores are not able to sell...the fruit is bad, the meat low quality...*” In addition, transportation was cited a barrier to accessing healthy food by a few focus group participants and interviewees. One shared, “*Some places are only accessible by car; folks come to the food pantry and only get things based on what they can carry sometimes. Grocery stores accessible by T [stations] are some of the more expensive; so, cost of nutritious and high-quality food is a challenge.*”

As shown in Figure 60, more than half of East Boston includes regions where there is not a grocery store within half a mile, as indicated by light blue shading. The neighborhoods of Jamaica Plain, West Roxbury, and Hyde Park, and portions of Roxbury, Mattapan, and Dorchester are also characterized by sizable geographic areas with limited access to grocery stores. Much of these areas where there is no grocery store also do not include convenience

stores, drug stores, or specialty markets. In Dorchester, grocery store access is concentrated in the northern region, with convenience stores and drug stores covering the remaining area where grocery store access is within half a mile of residents.

Chronic Disease

Why is This Important?

Chronic disease is both prevalent and costly. Six in ten American adults have a chronic disease and four in ten have two or more.⁵² The total costs in the U.S. for direct health care treatment for chronic health conditions totaled \$1.1 trillion in 2016—equivalent to 5.8 percent of the U.S. gross domestic product (GDP).⁵³ Although chronic diseases are among the most common and costly health problems, they are also among the most preventable through changes in behavior such as reduced use of tobacco and alcohol and improved diet and physical activity. Two of the most preventable chronic diseases, heart disease and diabetes, accounted for an estimated 715,000 deaths in 2016.⁵⁴ As seen across other health issues, many chronic conditions such as heart disease, diabetes, and asthma disproportionately affect communities of color, lower income individuals, and residents of low resourced neighborhoods, the same groups more likely to experience employment, financial, and housing insecurity.

Key Findings in This Section

Among focus group and interview participants, diabetes was frequently mentioned as a community concern that impacts both adults and children, followed by pediatric asthma. While there is a low prevalence of diabetes and asthma in Boston (9% and 11% respectively), there were significant differences across the population. Black and Latino residents have a higher prevalence of diabetes and experience higher diabetes-related hospitalization and death rates than White residents. Similar to diabetes, there were disparities in the distribution of asthma across the population, including by race/ethnicity, socioeconomic status, and neighborhood. Black and Latino adults and children experience significantly higher asthma-related emergency department visits compared to White adults and children. Participants shared that young children living in poverty are disproportionally affected by pediatric asthma as a result of poor environmental factors and/or poor living conditions including exposure to air pollutants, rodents, mold, tobacco smoke, and lead. Also disproportionally affected by diabetes and asthma are residents of Roxbury and Dorchester, who experience diagnoses and hospitalizations at significantly higher rates than residents in the rest of Boston. Additionally, in 2013-2017, one-quarter (25%) of Boston adults reported being diagnosed with hypertension, one of the most significant risk factors for heart disease and stroke.

Diabetes

Diabetes was frequently mentioned as a community concern that had an impact on both adults and children. Many focus group and interview participants discuss diabetes in connection with obesity. For example, participants in East Boston explained that stress often triggers unhealthy coping mechanisms such as unhealthy eating that cause illness. One resident shared, *“I work with a lot of women and what I see is a lack of motivation [to exercise]. Moms have to work so much and all of their energy goes to mechanisms to cope like eating poorly; stress often means weight gain.”* Further, key informants perceived the rise in Type 2 Diabetes symptoms among young children—particularly among Black and Latino children. One interviewee shared, *“I’m seeing many of our elementary-aged kids exhibiting early signs of Type 2 Diabetes...the darkening ring behind the neck, blurred vision, and frequent urination. Lots of times parents don’t realize that these early symptoms are dangerous.”* Lastly, a couple of focus group participants

from Dorchester described challenges affording insulin, sharing that they often skipped doses to make it last longer.

While the prevalence of reported diabetes across Boston was 9% in 2013-2017, there were significant differences in the distribution of diabetes across the population. Compared to their counterparts, a significantly higher proportion of adults who identified as Black (15%), Latino (12%), older (≥ 50 years; 16-23%), Boston Housing Authority residents (18%), renters receiving rental assistance (17%), adults with a high school education or less (12%-18%), immigrants who have resided in the US for more than 10 years (14%) reported a diabetes diagnosis (Figure 61).

Figure 61. Percent Adults Reporting Diabetes Diagnosis, by Boston and Selected Indicators, 2013, 2015, and 2017

NOTES: NA denotes where data not presented due to insufficient sample size; Bars with pattern indicate reference group for its specific category; Asterisk (*) denotes where estimate was significantly different compared to reference group within specific category ($p < 0.05$); Error bars show 95% confidence interval

In 2013-2017, compared to the rest of Boston, a significantly higher percent of adults in Mattapan (18%), Roxbury (14%), and Dorchester (02122, 02124; 13%) reported a diabetes diagnosis (Figure 62). By comparison, a significantly lower percent of adults in Allston/Brighton (4%), Fenway (4%), Back Bay (5%), Charlestown (5%), Jamaica Plain (5%), and South Boston (6%) reported a diabetes diagnosis during this period.

Figure 62. Percent Adults Reporting Diabetes Diagnosis, by Boston and Neighborhood, 2013, 2015, and 2017

DATA SOURCE: Boston Public Health Commission, Boston Behavioral Risk Factor Surveillance System, 2013, 2015, and 2017 combined

DATA ANALYSIS: Boston Public Health Commission, Research and Evaluation Office

NOTE: Asterisk (*) denotes where neighborhood estimate was significantly different compared to the rest of Boston ($p < 0.05$); Error bars show 95% confidence interval

In 2016-2017, there were 22.4 diabetes-related hospitalizations per 10,000 Boston residents. Notably, the diabetes hospitalization rate for Black residents (46.2 hospitalizations per 10,000 residents) was three times the rate for White residents (14.5 hospitalizations per 10,000 residents). Black and Latino residents were significantly more likely than White residents to experience a diabetes-related hospitalization, while Asian residents were significantly less likely than White residents to experience a diabetes-related hospitalization. The diabetes hospitalization rate increased with age: compared to adults 65 years of age or older, younger and middle-aged adults were significantly less likely to experience diabetes-related hospitalizations (Figure 63).

Figure 63. Diabetes Hospitalization Rate, by Boston and Selected Indicators, Age-Adjusted Rate per 10,000 Residents, 2016–2017 Combined

DATA SOURCE: Massachusetts Center for Health Information and Analysis, Acute Hospital Case Mix Databases, 2016–2017 Combined
 DATA ANALYSIS: Boston Public Health Commission, Research and Evaluation Office

NOTES: Bars with pattern indicate reference group for its specific category; Asterisk (*) denotes where estimate was significantly different compared to reference group within specific category ($p < 0.05$); For age stratifications, rates are age-specific rates per 10,000 residents

The diabetes hospitalization rate significantly was significantly higher in Roxbury (44.4 hospitalizations per 10,000 residents) compared to the rest of Boston (Boston overall minus Roxbury). Mattapan, Dorchester (02122, 02124), Hyde Park, Dorchester (02121, 02125), and the South End also had significantly higher diabetes hospitalization rates. The diabetes hospitalization rate was lowest in Allston/Brighton and Back Bay, where it was significantly lower than the rest of Boston. See [APPENDIX I](#) for data by neighborhood.

Similar to patterns for diabetes diagnoses and hospitalizations, the diabetes mortality rate for Black (40.7 deaths per 10,000 residents) and Latino (28.7 deaths per 10,000 residents) residents was significantly higher than that for White residents (17.4 deaths per 10,000 residents) in 2016–2017 (Figure 64). The diabetes mortality rate among Asian residents (9.1 deaths per 10,000 residents) was nearly half of that for White residents during the same period.

Figure 64. Diabetes Mortality Rate, by Boston and Race/Ethnicity, Age-Adjusted Rate per 100,000 Residents, 2016–2017 Combined

DATA SOURCE: Boston Public Health Commission, Boston resident deaths, 2016–2017 Combined

DATA ANALYSIS: Boston Public Health Commission, Research and Evaluation Office

NOTES: Bars with pattern indicate reference group for its specific category; Sample size for Asian is ≤ 20 and rate should be interpreted with caution; Asterisk (*) denotes where estimate was significantly different compared to reference group within specific category ($p < 0.05$)

Looking across the Boston neighborhoods, the diabetes mortality rate in Roxbury (44 deaths per 10,000 residents), Dorchester (02122 and 02124; 37 deaths per 10,000 residents), and Mattapan (36 deaths per 10,000 residents) were the highest in the city across neighborhoods. See [APPENDIX I](#) for data.

Asthma

After diabetes and obesity, pediatric asthma was the most frequently cited chronic concern among focus group participants and key informants, especially for those who lived or worked in Dorchester, Roxbury, and East Boston. One key informant explained, *“So many of our kids...are suffering from chronic and active asthma, where they need their inhalers every single day.”* Participants shared that young children living in poverty are disproportionality affected by pediatric asthma as a result of poor environmental factors and/or poor living conditions including exposure to air pollutants, rodents, mold, tobacco smoke, and lead. For example, one key informant from Chinatown explained that the neighborhood’s proximity to the highway, and poor ventilation systems in older buildings exacerbated asthma rates. One resident shared, *“Asthma rates are high [in Chinatown]. This is related to the prevalence of tobacco use, as well as living conditions; so many housing developments have pests like rats and cockroaches.”* Further, pediatric asthma was also described as a factor affecting school attendance. Key informants explained that when children are sent home due to asthma concerns, it impedes a parent’s ability to maintain stable employment. One interviewee shared, *“It’s really hard for parents to pick kids up from school or make meetings, because making meetings means missing work.”*

Second hand smoke from tobacco and marijuana were also mentioned as concerns in the home and workplace. For example, an interviewee that worked with children explained, *“We’re seeing a trend of increases in asthma; this can go in line with more experiences of second-hand smoke now that marijuana is legalized. A lot of kids are in cars or homes where marijuana smoke is present.”*

In 2013-2017, across Boston 11% of adults reported a diagnosis of asthma (Figure 65). The prevalence of asthma was significantly higher for adults who identified as Black (15%), female (15%), residents of Boston Housing Authority units (18%), renters receiving rental assistance (22%), renters not receiving assistance (11%), adults with less than a high school education (16%), LGBTQ (17%), and less than \$25,000 income (16%) compared with their counterparts. Of note, the a significantly lower proportion of Asian adults (5%) and immigrants living in the US for less than 10 years (4%) or 10 years or more (9%) reported an asthma diagnosis.

Figure 65. Percent Adults Reporting Having Asthma, by Boston and Selected Indicators, 2013, 2015, and 2017 Combined

DATA ANALYSIS: Boston Public Health Commission, Research and Evaluation Office

NOTES: Bars with pattern indicate reference group for its specific category; Asterisk (*) denotes where estimate was significantly different compared to reference group within specific category ($p < 0.05$); Error bars show 95% confidence interval

The neighborhoods of Roxbury (15%) and Dorchester (02122, 02124; 15%) had a significantly higher proportion of residents with diagnosed asthma compared to the rest of Boston (Figure 66). Nearly 16% of Mattapan's adult residents indicated that they have asthma; however, this estimate is not significantly different than the rest of Boston potentially due to insufficient statistical power.

Figure 66. Percent Adults Reporting Having Asthma, by Boston and Neighborhood, 2013, 2015, and 2017 Combined

DATA SOURCE: Boston Public Health Commission, Boston Behavioral Risk Factor Surveillance System, 2013, 2015, and 2017 combined

DATA ANALYSIS: Boston Public Health Commission, Research and Evaluation Office

NOTE: Asterisk (*) denotes where neighborhood estimate was significantly different compared to the rest of Boston ($p < 0.05$); Error bars show 95% confidence interval

One in four Boston Public High School students (26%) reported an asthma diagnosis, as seen in Figure 67. A significantly greater percent of Asian (28%) and Latino (29%) high school students reported being diagnosed with asthma compared to White students (19%). The prevalence of diagnosed asthma among female students (23%) was significantly lower than that of male students (29%). When looking at patterns by race/ethnicity and sex, the asthma prevalence among Latina female students (29%) was significantly higher than that of White female students (15%).

Figure 67. Percent Boston Public High School Youth Reporting Having Asthma, by Boston and Selected Indicators, 2013 and 2017 Combined

DATA SOURCE: Centers for Disease Control and Prevention and Boston Public Schools, Youth Risk Behavior Survey, 2013 and 2017 combined

DATA ANALYSIS: Boston Public Health Commission, Research and Evaluation Office

NOTE: Bars with pattern indicate reference group for its specific category; Asterisk (*) denotes where estimate was significantly different compared to reference group within specific category ($p < 0.05$); Error bars show 95% confidence interval

In 2016-2017, the asthma-related emergency department visit rate for Black (213.6 visits per 10,000 residents) and Latino (122.7 visits per 10,000 residents) residents was over five and three times higher than that for White residents (36.9 visits per 10,000 residents), respectively (Figure 68). The asthma ED rate for Asian residents (24.0 visits per 10,000 residents) was significantly lower than that for White residents during this same period.

Figure 68. Asthma Emergency Department Visit Rate, by Boston and Race/Ethnicity, Age-Adjusted Rate per 10,000 Residents, 2016-2017 Combined

DATA SOURCE: Massachusetts Center for Health Information and Analysis, Acute Hospital Case Mix Databases, 2016-2017 Combined

DATA ANALYSIS: Boston Public Health Commission, Research and Evaluation Office

NOTES: Bars with pattern indicate reference group for its specific category; Asterisk (*) denotes where estimate was significantly different compared to reference group within specific category ($p < 0.05$)

The asthma emergency department (ED) visit rate was highest in Roxbury, followed by Mattapan, and Dorchester (02122, 02124), Dorchester (02121, 02125), the South End, and Hyde Park – each of which had rates that were significantly higher than the asthma ED rate compared to the rest of Boston (Figure 69). The asthma ED visit rate was significantly lower in the neighborhoods of West Roxbury, East Boston, Back Bay, South Boston, Allston/Brighton, Fenway, Jamaica Plain, Roslindale, and Charlestown.

Figure 69. Asthma Emergency Department Visit Rate, by Boston and Neighborhood, Age-Adjusted Rate per 10,000 Residents, 2016–2017 Combined

DATA ANALYSIS: Boston Public Health Commission, Research and Evaluation Office

NOTE: Asterisk (*) denotes where neighborhood estimate was significantly different compared to the rest of Boston ($p < 0.05$)

Figure 70 shows asthma ED visit rates for children under 18 across the Boston neighborhoods. Dorchester (02121, 02125) and (02122, 02124), Mattapan, and Roxbury had significantly higher rates of asthma emergency department visits for children under 18 compared to the rest of Boston.

Figure 70. Asthma Emergency Department Visit Rate (Children Under 18 Years), by Boston and Neighborhood, Age-Specific Rate per 10,000 Residents, 2016–2017 Combined

 DATA ANALYSIS: Boston Public Health Commission, Research and Evaluation Office

NOTES: Sample sizes for Asian in the 0–2 years, 6–12 years, and 13–17 years are ≤ 20 and rates should be interpreted with caution; Bars with pattern indicate reference group within each age category; Asterisk (*) denotes where estimate was significantly different compared to reference group within each specific age category ($p < 0.05$)

As shown in [APPENDIX I](#), in 2017, there were 14.8 asthma hospitalizations per 10,000 residents, significantly lower than the hospitalization rate in 2016 (16.8 hospitalizations per 10,000 residents). Examining the age-adjusted asthma hospitalization rates by race/ethnicity,

Figure 72 shows that the asthma hospitalization rate for Black residents (28.7 hospitalizations per 10,000 residents) was five times higher than that for White residents (5.6 hospitalizations per 10,000 residents) and 3.5 times higher for Latino residents (19.7 hospitalizations per 10,000 residents) relative to White residents in 2016-2017.

Figure 72. Asthma Hospitalization Rate, by Boston and by Race/Ethnicity, Age-Adjusted Rate per 10,000 Residents, 2016-2017 Combined

DATA SOURCE: Massachusetts Center for Health Information and Analysis, Acute Hospital Case Mix Databases, 2016-2017 Combined
 DATA ANALYSIS: Boston Public Health Commission, Research and Evaluation Office
 NOTES: Bars with pattern indicate reference group for its specific category; Asterisk (*) denotes where estimate was significantly different compared to reference group within specific category ($p < 0.05$)

While there were nearly 15.8 asthma-related hospitalizations per 10,000 residents across Boston, there were vast differences by neighborhood. Roxbury, Mattapan, Dorchester (02121, 02125), and Dorchester (02122, 02124) had rates higher compared to the rest of Boston (Figure 73).

Figure 73. Asthma Hospitalization Rate, by Boston and by Neighborhood, Age-Adjusted Rate per 10,000 Residents, 2016-2017 Combined

DATA SOURCE: Massachusetts Center for Health Information and Analysis, Acute Hospital Case Mix Databases, 2016-2017 Combined
 DATA ANALYSIS: Boston Public Health Commission, Research and Evaluation Office
 NOTES: Asterisk (*) denotes where neighborhood estimate was significantly different compared to the rest of Boston ($p < 0.05$)

Cancer

While cancer is the leading cause of death in the city of Boston, it was not frequently mentioned as a pressing concern among focus group and interview participants. The exception to this was in groups in East Boston and Chinatown. In Chinatown, focus group participants perceived that the high rates of tobacco use impacted cancer rates in their neighborhood. East Boston participants spoke of cancer in the context of environmental concerns; specifically, residents worried about an electrical plant that was being built by the harbor. A few key informants described the need for more supports for caretakers. One shared, *“Family members of a cancer patient likely find it hard to think critically about other matters when they are focused on their loved one struggling with such a difficult condition.”*

Cancer Screening

When discussing cancer screenings, a few interviewees and focus group participants noted that some of the biggest barriers to cancer screenings included lack of awareness about the importance of screening, discomfort and fear of screenings particularly those considered more invasive such as colonoscopies, inability to take time off work, confusion about changing screening guidelines, and for a few, insurance and transportation issues.

Nearly nine in ten women 50 to 74 years of age across Boston (88%) reported receiving a mammogram in the past two years (Figure 74). Of note, compared to their counterparts, Latina women (93%) and immigrants living in the US for fewer than 10 years (97%) were significantly more likely to report receiving a mammogram in the past two years. There was no significant difference by Boston neighborhoods in the percent of women who reported receiving a mammogram in the past two years (data in [APPENDIX I](#)).

The following graphs provide data on women who reported receiving a pap smear, an important screening for cervical cancer (Figure 75 and Figure 76). In 2013–2017, 84% of Boston women (21–64 years of age) reported receiving a pap smear test in the past two years. The prevalence of reported pap tests in Fenway (65%) was significantly lower than the rest of Boston in 2013–2017. By comparison, the prevalence of pap tests among residents of Charlestown (91%), Jamaica Plain (89%), and Roslindale (89%) was significantly higher than the rest of Boston.

In 2013-2017, only two-thirds (65%) of Boston adults 50 to 75 years of age reported ever receiving a colonoscopy or sigmoidoscopy (Figure 77). Compared to their counterparts, a significantly lower proportion of Asian adults (50%), immigrants living in the US for less than 10 years (37%), residents with incomes <\$25,000 (63%), and adults who were out of work (55%) reported receiving colon cancer screening.

Data on colon cancer screening by neighborhood can be found in [APPENDIX I](#). A data point to note is that the prevalence of colon cancer screening among adults 50 to 75 years of age was lowest in East Boston (56%), a difference that was significantly lower than the rest of Boston in 2013-2017.

Cancer Incidence

According to the Massachusetts Department of Public Health, in 2015, cancer incidence rates for Asian (390.5 per 100,000 population) and Latino (349.4 per 100,000 population) residents in Boston were significantly lower than for White residents (546.7 per 100,000 population) (Figure 78). Between 2001 to 2015, cancer incidence rates for Boston significantly decreased over time (see [APPENDIX I](#) for data). A significant decrease in incidence rates was also seen among White residents in Boston between 2001 and 2015.

Figure 78. Overall Invasive Cancer Incidence Rate, by Boston and Race/Ethnicity, Age-Adjusted Rate per 100,000 Residents, 2015

Figure 79 shows incidence rates by select types of cancer and by race/ethnicity. The incidence rate for female breast cancer in Boston was 132.7 cases per 100,000 population, followed by prostate cancer (126.7 per 100,000), and lung and colorectal cancers (64.7 and 40.9 per 100,000, respectively). Colorectal and prostate cancer incidence rates were statistically higher for Black residents compared to White residents.

Cancer Mortality

Quantitative data around cancer mortality from the Massachusetts Department of Public Health show that the overall cancer mortality rate in Boston was 160.0 per 100,000 residents (Figure 80). Rates of cancer mortality differed, however, across different subgroups. Across racial/ethnic groups, Black residents experienced significantly higher rates of cancer mortality (181.9 deaths per 100,000 residents) compared to White residents. Females (138.5 per 100,000) in Boston had significantly lower cancer mortality rates than males (192.5 per 100,000). Figure 81 shows that between 2011 and 2017, cancer mortality rate had significantly decreased over time.

DATA ANALYSIS: Boston Public Health Commission, Research and Evaluation Office

NOTES: Change over time was statistically significant (decrease over time)

Figure 82 shows mortality rates for select types of cancer by race/ethnicity. Among the select cancer types, the highest mortality rate for Boston was for lung cancer (36.5 deaths per 100,000 residents). Black residents experienced significantly higher mortality rates for prostate cancer (49.8 deaths per 100,000 residents) when compared to White residents (19.1 deaths per 100,000 residents).

Heart Disease and Stroke

Heart disease and stroke were only mentioned by a few key informants, and neither topics emerged as a priority theme in focus groups. The key informants that did mention it perceived that there was a trend of early onset heart disease, with one sharing, “*We are seeing a lot of cases of heart disease and COPD in younger populations.*” Another key informant who worked with seniors identified congestive heart failure as a common issue among the aging population.

Although hypertension was not an issue often discussed by focus group participants, it is the biggest risk factor for heart disease and stroke.⁵⁵ In 2013–2017, one-quarter (25%) of Boston adults reported being diagnosed with hypertension (Figure 83). A significantly higher proportion of adults who identified as Black (38%), Latino (26%), aged 35–49 (12%), aged 50–65 (40%), 65 and older (65%), residents living in Boston Housing Authority units (39%), renters on rental assistance (37%), and immigrants living in the US for more than ten years (35%) reported being diagnosed with hypertension or high blood pressure, compared to their counterparts. Additionally, there was a consistent socioeconomic gradient in the prevalence of hypertension: a significantly higher percent of adults with less than a high school education (42%), a high school education (28%), incomes <\$25,000 (34%); incomes \$25,000–\$49,999 (27%), out of work (27%), and other employment statuses (38%) reported a hypertension diagnosis compared with their counterparts of higher socioeconomic status. A significantly lower percent of adults who identified as Asian (16%), renters without assistance (19%),

residents with other housing arrangements (19%), immigrants living in the US for less than ten years (10%), and LGBTQ (19%) reported a hypertension diagnosis when compared to the comparison groups.

Figure 83. Percent Adults Reporting Hypertension, by Boston and Selected Indicators, 2013, 2015, 2017 Combined

DATA ANALYSIS: Boston Public Health Commission, Research and Evaluation Office

NOTES: Bars with pattern indicate reference group for its specific category; Asterisk (*) denotes where estimate was significantly different compared to reference group within specific category ($p < 0.05$); Error bars show 95% confidence interval

As shown in Figure 84, there was substantial variation in the prevalence of diagnosed hypertension across Boston neighborhoods. A significantly higher proportion of residents in Mattapan (38%), Roxbury (30%), Dorchester (02121, 02125; 30%); and Dorchester (02122, 02124; 30%) reported a hypertension diagnosis compared to the rest of Boston. By comparison, the neighborhoods of Fenway (13%), Allston/Brighton (17%), Charlestown (19%), Jamaica Plain (20%), and Back Bay (21%) had a significantly lower percent of residents reporting a hypertension diagnosis than the rest of Boston.

Figure 84. Percent Adults Reporting Hypertension, by Boston and Neighborhood, 2013, 2015, 2017 Combined

DATA ANALYSIS: Boston Public Health Commission, Research and Evaluation Office

NOTE: Asterisk (*) denotes where neighborhood estimate was significantly different compared to the rest of Boston ($p < 0.05$); Error bars show 95% confidence interval

In 2017, 3% of adults across Boston reported ever being diagnosed with a heart attack. As shown in the [APPENDIX I](#), there was not a statistically significant difference in these patterns by sex, but there was a significantly higher proportion of Black (4%) and Latino (5%) adults reported a heart attack compared to White adults (2%).

In 2016-2017, the heart disease hospitalization rate for Black residents (135.3 hospitalizations per 10,000 residents) was 48% greater than the rate for White residents (90.5 hospitalizations per 10,000 residents), a difference that was statistically significant (Figure 85). The heart disease hospitalization rate for Asian residents (39.4 hospitalizations per 10,000 residents) was significantly lower than that for White residents.

Figure 85. Heart Disease Hospitalization Rate, by Boston and Race/Ethnicity, Age-Adjusted Rate per 10,000 Residents, 2016-2017 Combined

DATA SOURCE: Massachusetts Center for Health Information and Analysis, Acute Hospital Case Mix Databases, 2016-2017 Combined

DATA ANALYSIS: Boston Public Health Commission, Research and Evaluation Office

NOTES: Bars with pattern indicate reference group for its specific category; Asterisk (*) denotes where estimate was significantly different compared to reference group within specific category ($p < 0.05$)

As shown in Figure 86, hospitalization rates for heart disease differed by neighborhood. Compared to the rest of Boston (Boston overall minus the population of that specific neighborhood), the age-adjusted hospitalization rate for heart disease was significantly higher for Roxbury, East Boston, Hyde Park, Dorchester (02122, 02124), Dorchester (02121, 02125), Mattapan, and the South End. The neighborhoods of Back Bay, Fenway, West Roxbury, Allston/Brighton, and Jamaica Plain each had a significantly lower heart disease hospitalization rate than the rest of Boston.

Figure 86. Heart Disease Hospitalization Rate, by Boston and Neighborhood, Age-Adjusted Rate per 10,000 Residents, 2016-2017 Combined

DATA SOURCE: Massachusetts Center for Health Information and Analysis, Acute Hospital Case Mix Databases, 2016-2017 Combined

DATA ANALYSIS: Boston Public Health Commission, Research and Evaluation Office

NOTES: Asterisk (*) denotes where estimate was significantly different compared to the rest of Boston

As shown in [APPENDIX I](#), from young adulthood to 50 to 64 years of age, the heart disease mortality rate was highest for Black adults. More specifically, among adults 18 to 34 years of age and 35 to 49 years of age, the heart disease mortality rate for Black adults was statistically higher than the mortality rate for White adults. For adults 65 years of age and older, the heart disease mortality rate for Asian, Black, and Latino adults was significantly lower than that for White residents.

As with other chronic conditions, in 2016-2017 the heart disease mortality rate was highest in East Boston (174 deaths per 10,000 residents), where it was 36% higher than the rest of Boston (Figure 87). The heart disease mortality rate was also significantly higher in East Boston, Hyde Park, Roxbury, and South Boston than the rest of Boston. The heart disease mortality rate was significantly lower in the neighborhoods of Back Bay, Fenway, and the South End.

Figure 87. Heart Disease Mortality Rate in Boston, by Neighborhood, Age-Adjusted Rate per 100,000 Residents, 2016–2017 Combined

NOTES: Asterisk (*) denotes where estimate was significantly different compared to the rest of Boston

As shown in Figure 88, in 2017 3% of adults across Boston reported being diagnosed with a stroke in the past year. The prevalence of stroke among Black adults (5%) was more than twice the prevalence among White adults (2%), a difference that was statistically significant. A significantly higher proportion of adults with incomes <\$25,000 (6%) or \$25,000–\$49,999 (2%), residents of Boston Housing Authority units (6%), renters with rental assistance (7%), and residents with less than a high school education (5%) reported a diagnosis of stroke relative to residents with higher socioeconomic status. The prevalence of a stroke diagnosis was significantly lower for LGBTQ adults (1%) relative to heterosexual and non-transgender adults (3%).

Figure 88. Percent Adults Reporting Having Ever Had a Stroke, by Boston and Selected Indicators, 2017

In 2016-2017, for Boston overall the stroke-related mortality rate was 29.2 deaths per 100,000 residents (Figure 89). Across racial and ethnic groups, for Black (41.2 deaths per 10,000 residents) and Asian (30.6 deaths per 10,000 residents), rates were significantly higher than that for White residents (22.8 deaths per 10,000 residents). Neighborhood level data mortality data for stroke can be found in [APPENDIX I](#).

Mental Health

Why is This Important?

Mental and physical health are intricately connected, and mental illness is among one of the leading causes of disability in the United States. Suicide, for example, is the 10th leading cause of death in the United States.⁵⁶ Mental health disorders can affect individuals' mental health treatment, maintenance of physical health, and engagement in health-promoting behaviors.⁵⁷ People with depression, for example, have an increased risk of cardiovascular disease, diabetes, stroke, Alzheimer's disease, and osteoporosis.⁵⁸ Social, environmental, and genetic factors across the lifespan, as well as physical health, such as chronic illnesses, are risk factors for mental disorders such as depression and anxiety.^{59,60} Mental health concerns have substantial economic costs as well: total spending from all public and private sources for mental health and substance use treatment in 2009 was \$171.7 billion and is expected to total \$280.5 billion in 2020.⁶¹

"We want help, it's not in our community to get help because we were raised... to not talk about what happens in our house; but when we ask for help, you get somebody who clearly does not understand what you're going through." — Focus group participant

Key Findings in This Section

Mental health issues were described as a priority concern across almost all focus group and interviews, and often discussed in connection with trauma and poverty. Stress, anxiety, and depression were the most frequently cited challenges among Boston residents, especially those who identify as LGBTQ, low-income, seniors, children, immigrants, and communities of color. Surveillance and survey data indicate that anxiety and depression are somewhat common across Boston residents, with one in five adult residents reporting that they felt persistent anxiety and one in eight reporting persistent sadness. Furthermore, the proportion of residents reporting persistent anxiety has increased over time; a higher proportion of females, Latinos, lower income individuals, younger, LGBTQ, and unemployed residents reported persistent anxiety than other groups.

The age-adjusted suicide rate for Boston is 6.7 deaths per 100,000 residents, with the highest rates occurring among White residents, men, and individuals ages 45-64. Concern for mental health issues among children and youth were a prominent theme in focus groups and interviews and this was validated through quantitative data: about one-third of Boston public high school students reported feeling persistent sadness and this has grown substantially over the past few years. The rate of students reporting persistent sadness is even higher among those who identify as Latino, Black, female, and LGBTQ. Nearly one in eight Boston public high school students (12%) has reported seriously considering suicide and 7.6% reported having attempted suicide, with rates for females, Latinos, and those who identify as LGBTQ as higher than for other groups. While statistics indicate that the proportion of people receiving treatment for depression has grown, barriers such as stigma, cultural and linguistic differences, and lack of providers constrain access to services for many residents.

Depression and Anxiety

Mental health issues were described as a priority concern across almost all focus group and interviews, and often discussed in connection with trauma. Stress, anxiety, and depression were the most frequently cited challenges among Boston residents, especially those who belong to underrepresented groups; specific groups that were mentioned include: LGBTQ, low-income residents, seniors, children, immigrants, and communities of color. In conversations, mental health issues were often discussed in relation to social determinant factors such as poverty, employment, and safety. One interviewee summarized, *“Many residents are significantly impacted by untreated mental health, addiction, and untreated chronic conditions. They are at significant disadvantages in terms of the social determinants of health; communities and families that have multigenerational issues around poverty, lack of education, histories of trauma and violence...”* Additional factors affecting mental health, according to key informants, included: unstable housing situations; parental incarceration, especially for Black and Latino men; and domestic violence.

Immigrants and communities of color were described as especially vulnerable to mental health issues due to limited English language skills, cultural norms, and stigma related to seeking mental health services. In focus groups in East Boston and Chinatown, for example, residents described the need to address issues such as migratory trauma or domestic violence but indicated strong cultural influences at play, with one sharing, *“We don’t take care of ourselves emotionally; as Hispanics, it’s hard to navigate all of these emotions and ask [for help].”* Another non-English speaking focus group participant expressed concerns about mental health issues related to unhealthy home situations in immigrant communities, sharing, *“Marriage and divorce are very difficult; there are a lot of people marrying because of necessity, even if it’s not the healthiest situation.”* In Dorchester, focus group participants perceived that discussing mental health issues was often taboo in Black communities, with one sharing, *“In the Black community we are raised on, ‘what goes on in this house stays in this house’; we aren’t seeing no therapist. It’s something a lot of us were raised with, but it’s crippling us.”* Further, undocumented residents were described as especially susceptible to mental health struggles, with one interviewee in the field sharing, *“Immigrant status is a big stressor for many residents—undocumented residents have been so nervous in the last couple of years with the proposed changes to immigration rules. Folks are dropping out of programs and services because they’re afraid.”*

Surveillance and survey data indicate that anxiety and depression are somewhat common across Boston residents. According to the Boston Behavioral Risk Factor Surveillance System (BBRFSS), nearly one in eight Boston residents (12.3%) indicated feeling persistent sadness in the past 30 days (feeling sad, blue, or depressed for more than 15 days within the past 30 days) (Figure 90). When examining responses by sub-groups, responses were significantly higher among Black residents, Latino residents, females, non-home owners, residents with less than some college education, those making less than \$50,000 a year, LGBTQ residents, and those not employed compared to the referent in their sub-group (shaded bar). Data by neighborhood and over time are provided in [APPENDIX I](#).

Figure 90. Percent Adults Reporting Persistent Sadness, by Boston and Selected Indicators, 2013, 2015, and 2017 Combined

DATA SOURCE: Boston Public Health Commission, Boston Behavioral Risk Factor Surveillance System, 2013, 2015, and 2017 combined

DATA ANALYSIS: Boston Public Health Commission, Research and Evaluation Office

NOTES: Persistent sadness is defined as feeling sad, blue, or depressed for more than 15 days within the past 30 days; Bars with pattern indicate reference group for its specific category; Asterisk (*) denotes where estimate was significantly different compared to reference group within specific category ($p < 0.05$); Error bars show 95% confidence interval

More than one in five Boston residents indicated that they have experienced persistent anxiety (feeling worried, tense, or anxious for more than 15 days within the past 30 days) (Figure 91). Responses were significantly lower among Asian residents compared to White residents, those who were 65+ years old compared to 18-34 years old, and foreign-born residents compared to U.S. born residents. However, females, non-homeowners, LGBTQ residents, those earning less than \$25,000 a year, and those not employed were significantly more likely than the referent in their sub-group to report experiencing persistent anxiety. Data on persistent anxiety by neighborhood can be found in [APPENDIX I](#).

Figure 91. Percent Adults Reporting Persistent Anxiety, by Boston and Selected Indicators, 2013, 2015, and 2017 Combined

DATA SOURCE: Boston Public Health Commission, Boston Behavioral Risk Factor Surveillance System, 2013, 2015, and 2017 combined

DATA ANALYSIS: Boston Public Health Commission, Research and Evaluation Office

NOTES: Persistent Anxiety is defined as feeling worried, tense, or anxious for more than 15 days within the past 30 days; Bars with pattern indicate reference group for its specific category; Asterisk (*) denotes where estimate was significantly different compared to reference group within specific category ($p < 0.05$); Error bars show 95% confidence interval

Data from the BBRFSS indicate a significant increase in the trend over time of the percentage of adults who reported persistent anxiety in the past 30 days, from 16.3% in 2010 to 21.7% in 2017 (see [APPENDIX I](#) for data). Additional data on persistent sadness and anxiety by various population characteristics can be found in [APPENDIX I](#).

Mental health concerns were not just specific to adults. Focus group and interview participants also expressed increasing concern about mental health issues experienced by children and teens. Key informants spoke of how poor social and economic factors exacerbate mental health issues for children; for example, poor children who are at risk of living under chronic stress or experiencing vicarious trauma through their parent's experiences. One interviewee explained, "Children feed off the stress of their parents. A child comes to school thinking, 'my parents don't

have rent money, we don't have any food' and it impacts their mental health and their ability to learn." Children of immigrants were also described as susceptible to mental health challenges because of competing pressures and identities, often serving as a *"liaison between both worlds"*. Though not as frequently discussed as stress, anxiety was also identified as a common concern for parents and young people who participated in focus groups. Online bullying and social media were mentioned as components of this anxiety, as well as high-pressures to perform in school.

The concern about youth mental health issues is validated by survey data. Responses from the Youth Risk Behavior Survey indicate approximately 30% of Boston public high school students reported feeling persistent sadness (measured by feeling sad or hopeless every day for 2 weeks or more in the past 12 months) (Figure 92). When looking at data by specific groups, female students (36.8%) were significantly more likely than male students (23.3%) and students who identify as LGBTQ (48.4%) were significantly more likely than students identifying as heterosexual/non-transgender (27.1%) to report feeling persistent sadness.

NOTE: Students were asked in the past 12 months if they felt sad or hopeless every day for 2 weeks or more; Bars with pattern indicate reference group for its specific category; Asterisk (*) denotes where estimate was significantly different compared to reference group within specific category ($p < 0.05$); Error bars show 95% confidence interval

The YRBS data in the previous graph were aggregated across years to provide a large enough sample for sub-group analyses. When examining YRBS data by year, Figure 93 shows a statistically significant increase over time, from 24.8% of Boston public high school students reporting persistent sadness in 2011 to 33.4% reporting the same in 2017.

Figure 93. Percent Boston Public High School Youth Reporting Persistent Sadness, by Boston and Over Time, 2011-2017

DATA ANALYSIS: Boston Public Health Commission, Research and Evaluation Office

NOTE: Students were asked in the past 12 months if they felt sad or hopeless every day for 2 weeks or more; Error bars show 95% confidence interval; Change over time was statistically significant (increase over time)

Suicide and Suicidal Ideation

Aggregating data from 2012-2016, the age-adjusted suicide rate for Boston overall is 6.7 deaths per 100,000 residents (Figure 94). Suicide rates were significantly lower among Asian and Latino residents compared to White residents. Rates were highest among males compared to females and those ages 45-64 years compared to the referent of 65+ years. Additional data by neighborhood in [APPENDIX I](#) show that Dorchester (zip code 02122, 02124) was the only neighborhood with a significantly higher suicide rate than the rest of Boston.

Figure 94. Suicide Rate, by Boston and Selected Indicators, Age-Adjusted Rate per 100,000 Residents, 2012-2016 Combined

DATA ANALYSIS: Boston Public Health Commission, Research and Evaluation Office

NOTES: Bars with pattern indicate reference group for its specific category; Asterisk (*) denotes where estimate was significantly different compared to reference group within specific category ($p < 0.05$); For age stratifications, rates are age-specific rates per 100,000 residents

Nearly one in eight Boston public high school students have reported seriously considering suicide (Figure 95). Responses were most likely among LGBTQ students, where nearly 26% indicated that they seriously considered suicide, compared to 9.9% of students who identified as heterosexual or non-transgender. Female students (15%) were also significantly more likely than male students (8.8%) to report considering suicide. The percentage of students who reported seriously considering suicide generally remained steady over time from 2011-2017 (Figure 96).

Figure 95. Percent Boston Public High School Youth Reporting Seriously Considering Suicide in the Past Year, by Boston and Selected Indicators, 2013, 2015, 2017 Combined

DATA ANALYSIS: Boston Public Health Commission, Research and Evaluation Office

NOTES: Students were asked if during the past 12 months, did they seriously consider attempting suicide; Error bars show 95% confidence interval; Change over time was not statistically significant

Similar to the pattern of suicide ideation, LGBTQ students, at 18.2%, were more likely to report attempting suicide in the past year compared to heterosexual/non-transgender students (5.9%) (Figure 97). There were also differences by race/ethnicity among students responding to this question. Latino students overall (9.2%) were significantly more likely than White students (6.0%) to report attempting suicide in the past year. Among male students, Black and Latino males were significantly more likely than White males to report attempting suicide in the past year.

Figure 97. Percent Boston Public High School Youth Reporting Attempting Suicide in the Past Year, by Boston and Selected Indicators, 2013, 2015, 2017 Combined

While the earlier figures indicated that the responses stayed generally the same over time on whether students considered suicide, Figure 98 shows a significant decrease in the percentage of students who reported attempting suicide in the past year, from 8.6% in 2011 to 5.6% in 2017.

Figure 98. Percent Boston Public High School Youth Reporting Attempting Suicide in the Past Year, by Boston and Over Time, 2011-2017

DATA ANALYSIS: Boston Public Health Commission, Research and Evaluation Office

NOTES: Students were asked if during the past 12 months, did they seriously consider attempting suicide; Error bars show 95% confidence interval; Change over time was statistically significant (decrease over time)

Social Connectedness

Connectedness is an important protective factor in mental health; having a trusted adult in one's life is one indicator of positive youth development and support. While two-thirds of Boston public high school students reported that they have at least one trusted adult at school, responses were significantly lower among Asian, Black, and Latino students (Figure 99). Responses among Asian and Latino students are particularly contrasted when broken out by gender. An additional indicator on youth connectedness to adults at school from the BPS Student Climate Survey can be found in [APPENDIX I](#).

Figure 99. Percent Boston Public High School Youth Reporting Having At Least One Trusted Adult at School, by Boston and Selected Indicators, 2013, 2015, 2017 Combined

DATA SOURCE: Centers for Disease Control and Prevention and Boston Public Schools, Youth Risk Behavior Survey, 2013, 2015, and 2017 combined

DATA ANALYSIS: Boston Public Health Commission, Research and Evaluation Office

The Boston Public Schools Student Climate Survey is conducted every year to students in grades 4-11. In 2018, nearly 60% of students indicated that they belong quite a bit or almost totally belong at school, while 6.8% of students reported feeling like they do not belong (Figure 100). Similarly, 60% of students reported quite or extremely accepted by other students at school, while 4.2% reported feeling not accepted at all (Figure 101).

DATA SOURCE: Boston Public Schools, Office of Data and Accountability, Student Climate Survey, 2018

Mental Health Service Utilization and Barriers

While there was no statistically significant increase over time in the percent of BBRFSS respondents who reported persistent sadness, there was a significant increase over time in the percent who indicated they were receiving treatment for depression. As shown in Figure 102, 13.9% of respondents in 2010 reported receiving treatment for depression while 18.5% reported receiving treatment in 2017.

Figure 102. Percent Adults Reporting Receiving Treatment for Depression in the Past Year, by Boston and Over Time, 2010-2017

DATA SOURCE: Boston Public Health Commission, Boston Behavioral Risk Factor Surveillance System, 2010, 2013, 2015, and 2017
DATA ANALYSIS: Boston Public Health Commission, Research and Evaluation Office
NOTES: Error bars show 95% confidence interval; Change over time was statistically significant (increase over time)

Among those who reported receiving treatment for depression, rates were significantly lower among Asian and Black residents compared to White residents and foreign-born residents

compared to those who were born in the U.S. (Figure 103). However, rates were higher among those 50-64 years old, females, BHA and renter with assistance, and LGBTQ residents compared to the referent in each of their sub-groups.

Figure 103. Boston Adult Residents Receiving Treatment for Depression in the Past Year by Selected Indicators, 2013, 2015, and 2017 Combined

These statistics mirror some of the themes discussed in the focus groups related to mental health services – where stigma, access barriers, and cultural competency concerns were challenges to getting the mental health care services needed. Specifically, focus group participants discussed that they perceived that mental health services were more easily available for some communities than others; where they saw gaps or challenges were specifically around services for children, non-English speakers, LGBTQ residents, seniors, and the homeless population.

Stigma around mental health was commonly discussed in key informant interviews and in many English and non-English focus groups as a challenge to seeking services. For example, one key informant explained, *“Mental health is kind of a taboo discussion; the community’s willingness to embrace mental health services is an issue.”* Focus group participants—namely in the neighborhoods of Dorchester, Mattapan, Chinatown, and East Boston—described issues of cost and language accessibility that create barriers to mental health access for these populations. Cost for these services was also noted as barrier for middle-income residents with private insurance who do not qualify for financial supports. Middle income seniors were identified as an underserved population, especially for homebound elders who need in-home support. One interviewee summarized, *“People spend down their savings very quickly for in-home [mental health] care.”*

Cultural and linguistic differences were described as barriers to mental health utilization for immigrant communities. One interviewee summarized, *“There’s a lack of mental health providers in general, and then when you add the cultural competency/language barriers among those providers it’s even harder.”* Other key informants explained how non-English speakers had to wait longer to receive services, with one sharing, *“The availability of interpreters at medical facilities often delays appointments, whether that is scheduling appointments in advance or the actual starting time of an appointment on the day of. And if an interpreter is not available, the client can have a very difficult time communicating with their physician.”*

Focus group participants, namely those from communities of color and immigrant residents, expressed frustration at the lack of mental health providers that reflect their lived experiences. For example, mothers who experienced violence in Dorchester explained being offered mental health services from clinicians who they identified as inexperienced and lacking racial awareness. As one focus group participant explained, *“We want help, it’s not in our community to get help because we were raised to not talk about what happens in our house; but when we ask for help, you get somebody who clearly does not understand what you’re going through. It’s not easy to balance.”* Others agreed and added, *“I got a grief counselor who was a White lady in her early 20s, and she keeps telling me ‘I understand, it’s going to be alright’ and in my mind I’m saying, ‘You do not understand. Have you ever lost somebody? How can you possibly understand what I’m going through?’ If you’re going to tell me you understand you need to have gone through the same things I have.”* Further, one key informant explained that traditional counseling services may not be the best approach for every population group; religious minority groups, for example—and it’s important to consider tailored approaches for each community: *“Not everyone needs counseling or medicine; it’s not easy to find a counselor who can think with you. Sometimes counselors can make things worse if [they] don’t understand the basics of your faith.”*

Other key informant participants pointed to systemic challenges to addressing community mental health issues. Participants described an insufficient number of providers in the community to meet the demand, noting long wait lists and limited resources for non-English speakers. Key informants with school-based experience spoke of the need for more full-time emotional supports in the school system, including social workers and counselors in every public school. Several key informants also cited larger workforce challenges that compounded these issues, including the struggle to attract and retain a diverse behavioral health work force; these challenges were attributed to low-wages, licensing demands, and costs of higher education or student debt. Key informants and focus group with parents identified a need for

additional mental health supports within schools and community-based organizations, especially for children who have experienced trauma or community violence.

Substance Use

Why is This Important?

According to the National Survey on Drug Use and Health (NSDUH), in 2017 about 19.7 million American adults (aged 12 and older) battled a substance use disorder.⁶² Alcohol abuse disorder is the most common, affecting 14.5 million people (74%). About 38% of adults in 2017 battled an illicit drug use disorder; an estimated 2.1 million people (or 28% of those with an illicit drug use disorder) had an opioid use disorder.⁶³ The impact of substance abuse on individuals, families, and communities is tremendous, including poor health, fraying social structures, abuse and neglect of children, and crime and violence. Substance abuse also has substantial economic cost: abuse of tobacco, alcohol, and illicit drugs is estimated to cost American society more than \$740 billion annually in lost workplace productivity, health care expenses, and crime.⁶⁴

Key Findings in This Section

“There is far too little access to treatment programs, and those that do exist are not linguistically and culturally competent.”—Key informant interviewee

Substance use was considered a priority health issue in many focus group and interview discussions. Participants mentioned a variety of substances including marijuana, prescription drug use, and opioids as being among the most concerning. Co-occurring mental health and substance use issues were frequently discussed among key informants, as well as the interrelationship between trauma, mental health, and substance use. Smoking among adults and youth, as well as e-cigarette and marijuana use among youth, have significantly decreased in Boston; however, there are significant differences by population groups. Notably, LGBTQ adults and youth are more likely to use tobacco, e-cigarettes, and marijuana, compared to heterosexual/non-transgender adults and youth; a similar pattern emerged among the LGBTQ population for alcohol consumption and prescription drug use. The majority of focus group participants and key informants who discussed substance use as a concern identified opioids as a persistent issue in Boston. The rate of opioid overdose deaths in Boston has significantly increased since 2013 and was highest among Latino residents, followed by White residents.

Perceptions of Substance Use

Substance use was considered a priority health issue in many focus group and interview discussions. Participants mentioned a variety of substances including opioids, marijuana, and prescription drug use as being among the most concerning. Co-occurring mental health and substance use issues were frequently discussed among key informants. Additionally, key informant interviewees discussed the interrelationship between trauma, mental health, and substance use. As one interviewee noted, “*Significant levels of trauma and adverse childhood*

events are really huge issues that contribute to a whole host of negative health outcomes, substance use being a big one of them.”

While not mentioned as frequently as opioids, a few focus group and interview participants did note that alcohol was a commonly abused substance, especially by those experiencing homelessness. Tobacco use was mentioned as a concern for specific population groups, particularly for those in Chinatown and those who identified as homeless. A couple of key informants discussed how older adults are vulnerable to addiction issues; one shared, *“There is also an intergenerational challenge [with substance use] ...a son or daughter’s means older folks are now taking care of their grandchildren; that must place a lot of stress on them if they weren’t expecting or prepared for it.”* Additionally, some key informant participants shared the perception that law enforcement is increasingly encountering residents with substance use issues and could benefit from additional support and training.

Participants were especially concerned about the impact of substance use disorders on young people. In Chinatown, East Boston, and Dorchester, for example, focus group participants perceived an increase in youth drug abuse, specifically mentioning marijuana, vaping, and prescription pills like Adderall. Some focus group participants and key informants reported that they believed that providers were over prescribing/diagnosing children, and as a result, enabling addictive behavior. For example, interviewees explained that conditions such as ADHD often mimic symptoms that are caused by trauma; there were perceptions that children are being overmedicated for these ailments because the root causes of their symptoms were not being addressed. One Roxbury resident who worked with children shared, *“There have been huge increases in ADHD diagnoses—especially in Black and Latino boys. It makes me wonder—how much of this is really ADHD and how much of these behavioral issues stem from trauma?”* Likewise, focus group participants in the South End echoed this sentiment, with one sharing, *“A lot of doctors are too quick to medicate; we need to ask what brought [children] to this point. If they have depression, they give them medications instead of finding out why this is happening and connecting them to other resources other than medicating them.”*

Tobacco and Marijuana Use

Tobacco use was described as a frequent concern among focus group participants in Chinatown; this was reiterated in the survey results with smoking being the top health concern among Chinatown residents who completed the CHNA survey. Interview participants described the need for more smoking cessation resources, especially for new immigrants and non-English speakers. One shared, *“Smoking remains a challenge in Chinatown. There should be an emphasis on education and support for people who want to know more about smoking and to change their behavior; behavior changes must be a long-term effort.”* Tobacco use was also mentioned as a common occurrence for residents who were housing insecure. One resident who identified as chronically homeless shared, *“Everybody smokes in the shelter; it’s rare when men don’t do it.”*

While Boston has seen a statistically significant decrease in smoking since 2010, nearly one in six adults (15.0%) reported being a current smoker in 2017 (Figure 104). As noted by focus groups participants, certain neighborhoods have higher rates of smoking. South End (which includes Chinatown) and Dorchester (zip codes 02122, 02124) have significantly higher rates of smoking than the rest of Boston, with over 20% of their adult populations reporting being a current smoker (Figure 105).

DATA ANALYSIS: Boston Public Health Commission, Research and Evaluation Office
NOTE: Asterisk (*) denotes where neighborhood estimate was significantly different compared to the rest of Boston ($p < 0.05$); Error bars show 95% confidence interval

Smoking status also varies within different groups as shown in Figure 106. Black residents are more likely to be current smokers than White residents (while Asian residents are less likely), non-homeowners in any housing situation categorized in the survey are more likely to be

smokers than homeowners, LGBTQ respondents are more likely to be smokers than heterosexual/non-transgender respondents, and those with lower levels of education, lower levels of income, and without full-time employment are more likely to be smokers than their higher socio-economic status counterparts.

Youth cigarette smoking rates in Boston have also significantly declined over time, from 10% of Boston high school students reporting being a current smoker in 2011 to only 3.1% of high school students in 2017 (Figure 107). Smoking rates among Boston high school students were significantly lower among Black students and females, and specifically among Black and Latina females when looking at rates within sex (Figure 108).

Figure 108. Percent Boston Public High School Youth Reporting Current Cigarette Smoking, by Boston and Selected Indicators, 2013, 2015, and 2017 Combined

DATA SOURCE: Centers for Disease Control and Prevention and Boston Public Schools, Youth Risk Behavior Survey, 2013, 2015, and 2017 combined

DATA ANALYSIS: Boston Public Health Commission, Research and Evaluation Office

NOTE: Current smoking is defined as smoking cigarette in the past 30 days; Bars with pattern indicate reference group for its specific category; Asterisk (*) denotes where estimate was significantly different compared to reference group within specific category ($p < 0.05$); Error bars show 95% confidence interval

A growing concern among focus group and interview participants was e-cigarettes or vaping, which was described as an increasingly popular substance used by young people and adults. However, data from the Youth Risk Behavior Risk Survey indicates that the use of e-cigarettes among high school students has significantly decreased, from 14.5% reporting use in 2015 down to 5.1% of high school students reporting any e-cigarette use in the past 30 days (data in [APPENDIX I](#)).

Key informants perceived that there were misconceptions of the health risks of vaping, with one sharing, “Children report that they may have tried vaping because the fruity flavors were enticing, and they did not know there were other chemicals involved.” Others explained how the discreet nature of these devices made it easier for young people to use in places like schools or in public, sharing, “E-cigarettes are discrete and appear like USB drives; a user can take a puff and put the device back in their pocket, so one does not always notice them out in public the way we do with cigarettes.”

E-cigarette use among youth does vary by different groups. At 18.3%, LGBTQ youth are significantly more likely to report having used e-cigarettes in the last 30 days than heterosexual or non-transgender youth (Figure 109). Additionally, White students are significantly more likely than Asian or Black students to use e-cigarettes.

Figure 109. Percent Boston Public High School Youth Reporting Current Electronic Cigarette Smoking, by Boston and Selected Indicators, 2015 and 2017 Combined

DATA SOURCE: Centers for Disease Control and Prevention and Boston Public Schools, Youth Risk Behavior Survey, 2015 and 2017 combined

DATA ANALYSIS: Boston Public Health Commission, Research and Evaluation Office

NOTE: Current electronic cigarette use is defined as any use of electronic cigarettes in the past 30 days; Electronic cigarettes are not limited to tobacco consumption only; Bars with pattern indicate reference group for its specific category; Asterisk (*) denotes where estimate was significantly different compared to reference group within specific category ($p < 0.05$); Error bars show 95% confidence interval

Marijuana concerns were discussed in multiple focus groups, particularly as they related to young people and particularly given the recent legalization of the substance. Those working with young people or in community-based settings described seeing an increase in marijuana use among students and parents in recent years, which they attributed to more social acceptance. However, YRBS data over the last few years indicates that marijuana use has remained steady since 2011, with approximately one-quarter of Boston high school students reporting current marijuana use (data in [APPENDIX I](#)).

Several focus group and interview participants commented on the variety of ways that residents are consuming marijuana, with one interviewee sharing: *“Marijuana used to be simple, something kids would do behind the school; but today there are so many forms of marijuana like brownies and gummy bears, and youth are organizing parties or gatherings to try these things.”*

Focus group participants from East Boston, Chinatown, and Allston/Brighton reported concerns for plans to open marijuana dispensaries in their neighborhoods. Those who identified as parents often spoke negatively of marketing campaigns that promoted marijuana use. One resident shared, *“It’s very difficult to talk to your kids about marijuana because dispensaries are here and [they are] pervasive.”* Another participant agreed and added, *“It’s really rare to find someone who doesn’t smoke weed...it’s so normal to them. Every day my 11-year-old has to drive by a billboard in East Boston that says ‘Smile, weed is legal.’ What kind of example is that?”* Key informants discussed the importance of early prevention in elementary and middle schools. One interviewee shared, *“We can’t stop [marijuana] use all together, but if we can delay first use as long as possible, that could go a long way to preventing more dangerous addictions as kids get older.”*

Quantitative data show that 18.5% of Boston adults reported using marijuana in the past 30 days. Figure 110 provides responses to this question by specific population characteristics, revealing that males are significantly more likely than females and LGBTQ adults are significantly more likely than heterosexual/non-transgender adults to report current marijuana use.

Figure 110. Percent Adults Reporting Current Marijuana Use, by Boston and Selected Indicators, 2017

NOTES: Bars with pattern indicate reference group for its specific category; Asterisk (*) denotes where estimate was significantly different compared to reference group within specific category ($p < 0.05$); Error bars show 95% confidence interval; NA denotes where data are suppressed due to insufficient sample size

Similar to patterns of adult marijuana use, LGBTQ youth (39.2%) were also significantly more likely than heterosexual/non-transgender youth to be current marijuana users (21.7%). Looking at the responses by race/ethnicity, Asian students were significantly less likely to report current marijuana use compared to White students (Figure 111).

Provided in [APPENDIX I](#) is additional data on marijuana, including marijuana dependence and abuse within hospital patient encounters.

Alcohol Use

Alcohol use was not discussed as frequently as opioids in focus group and interview discussions, but some participants did comment that, even with all of the concern about opioids, alcohol was still a commonly abused substance. This section presents data specifically on binge drinking, while data on heavy drinking (>60 alcoholic drinks for males and >30 for females in past 30 days) can be found in [APPENDIX I](#).

The percent of Boston adults reporting binge drinking (having 5 or more drinks on an occasion for men or 4 or more drinks on an occasion for women) has remained steady since 2010, with approximately one-quarter of Boston adult BRFSS respondents reporting this behavior (data over time presented in [APPENDIX I](#)). Figure 112 presents data across different population groups. There are several differences within groups, such as LGBTQ adults (30.5%) are significantly more likely than heterosexual/non-transgender adults (24.0%), males (29.8%) are significantly more likely than females (19.8%), and adults earning \$50,000 or more (32.5%) are significantly more likely than those earning \$25K-<\$50K (21.4%) or those earning <\$25K (18.5%) to report binge drinking. In terms of youth, over a quarter of high school youth reported current alcohol consumption (26.6%). Differences can be seen across sub-populations in Figure 113.

Figure 112. Percent Adults Reporting Binge Drinking, by Boston and Selected Indicators, 2013, 2015, and 2017 Combined

DATA SOURCE: Boston Public Health Commission, Boston Behavioral Risk Factor Surveillance System, 2013, 2015, and 2017 combined

Figure 113. Percent Boston High School Youth Reporting Current Alcohol Consumption, by Boston and Selected Indicators, 2013, 2015, and 2017

DATA SOURCE: Centers for Disease Control and Prevention and Boston Public Schools, Youth Risk Behavior Survey, 2013, 2015, and 2017 combined

DATA ANALYSIS: Boston Public Health Commission, Research and Evaluation Office

NOTE: Bars with pattern indicate reference group for its specific category; Asterisk (*) denotes where estimate was significantly different compared to reference group within specific category ($p < 0.05$); Error bars show 95% confidence interval

There has been a significant decrease since 2011 in the percent of Boston high school students who report binge drinking, with 16.6% in 2011 to 10.5% in 2017. However, there are significant differences by student characteristics. White students were more likely than those of racial/ethnic groups, female students were more likely than male students, and LGBTQ students were more likely than heterosexual/non-transgender students to report current binge drinking behaviors (Figure 114).

Figure 114. Percent Boston High School Youth Reporting Current Binge Drinking, by Boston and Selected Indicators, 2013, 2015, and 2017

Figure 115 and Figure 116 present hospital patient encounter data for alcohol poisoning and alcohol dependence/abuse. While White residents had the highest rates of hospital patient encounters for alcohol poisoning (Figure 115), Black residents had the highest rates of hospital patient encounters for alcohol dependence/abuse. In both instances, men had a much higher rate of hospital patient encounters than women.

Alcohol mortality data over time indicate that the alcohol mortality rate for Boston overall has significantly increased over time from 19.2 deaths per 100,000 residents in 2013 to 25.5 deaths per 100,000 residents in 2016 (Figure 117). Examining deaths by race/ethnicity, Latino residents had a significant increase in alcohol mortality rate, with 10.1 deaths per 100,000 in 2013 to 36.9 deaths per 100,000 residents in 2016. Alcohol mortality data by sex can be found in [APPENDIX I](#).

Figure 117. Alcohol Mortality Rate, by Boston and Race/Ethnicity, Age-Adjusted Rate per 100,000 Residents 12 Years and Over, 2013-2016

DATA SOURCE: Massachusetts Department of Public Health, Boston resident deaths, 2013-2016

DATA ANALYSIS: Boston Public Health Commission, Research and Evaluation Office

NOTES: Sample sizes for Latino for all years and Black for 2014 and 2015 are ≤ 20 and rates should be interpreted with caution; Data not shown for Asian due to insufficient sample size; Dashed line indicates reference group for statistical testing done for 2016 data; Asterisk (*) denotes where estimate was significantly different compared to reference group for 2016 data ($p < 0.05$); Change over time was statistically significant for Boston (increase over time) and Latino (increase over time)

Opioid and Other Drug Use

The majority of focus group participants and key informants who discussed substance use as a concern identified opioids as a persistent issue in Boston. While a few key informants indicated that major headway around substance use and the opioid epidemic has been made in recent years, more is needed to address the severity of the issue. Several informants indicated that heroin and Fentanyl use was on the rise, and that these substances were cheap and easily available. One key informant shared, *“Heroin is a real health issue; addiction to heroin has been pervasive for decades among some communities and populations.”* Some interviewees perceived that opioid use was on the rise in communities of color and cautioned the perception that it is a *“White problem.”* Further, one key informant reported that opioid use was increasing among parents, sharing, *“We’re seeing parents abusing drugs like heroin, which then leads to the DCF (Department of Children and Families) involvement and removing of children.”*

Focus group from Dorchester, Roxbury, and Chinatown as well as several interview participants reported concerns about used needles littering city streets, playgrounds, and parks across Boston. One resident shared, *“I’ve lived in Roxbury my whole life and now there are so many needles on the ground.”* Focus group participants in the South End echoed these sentiments and shared, *“Kids are walking by and seeing needles everywhere on the ground; we are concerned about children picking them in up in the streets.”* Residents who identified as active substance users acknowledge the problem of used needles across the city and shared that there are groups working to address the problem; however, more resources are needed. One explained, *“Something that the Drug Users Union is trying to do is show that we are responsible users by doing needle clean ups. We don’t want anybody to get hurt—especially children.”*

In many instances, opioid addiction starts with dependence of taking prescription pain medication. In 2017, Boston high school students were asked if they had ever taken prescription pain medication without a doctor's prescription or differently than how a doctor told them as shown in Figure 118. While fewer than 10% of Boston high school students reported this, LGBTQ students were significantly more likely – at 18.8% - to report this behavior compared to heterosexual/non-transgender students (7.2%).

Figure 118. Percent Boston Public High School Youth Reporting Prescription Drug Use without Doctor's Prescription/Differently How Told to Use It, by Boston and Selected Indicators, 2017

DATA SOURCE: Centers for Disease Control and Prevention and Boston Public Schools, Youth Risk Behavior Survey, 2017

DATA ANALYSIS: Boston Public Health Commission, Research and Evaluation Office

Question asked if students ever took prescription pain medicine without a doctor's prescription or differently than how a doctor told them to use it (counting drugs such as codeine, Vicodin, Hydrocodone, and Percocet)

NOTE: Sub-sample sizes by race/ethnicity were insufficient to provide stratified analyses. Bars with pattern indicate reference group for its specific category; Asterisk (*) denotes where estimate was significantly different compared to reference group within specific category ($p < 0.05$); Error bars show 95% confidence interval

In 2016-2017, there were 25.0 hospital patient encounter related to opioid overdoses per 10,000 residents (Figure 119). Opioid overdose hospital encounter rates were significantly higher for White residents than for Asian, Black, and Latino residents. Hospital encounter data for cocaine use can be found in [APPENDIX I](#).

Figure 119. Opioid Overdose Hospital Patient Encounters, by Boston and Selected Indicators, Age-Adjusted Rate per 10,000 Residents 12 Years and Over, 2016-2017 Combined

DATA SOURCE: Massachusetts Center for Health Information and Analysis, Acute Hospital Case Mix Databases, 2016-2017 Combined

DATA ANALYSIS: Boston Public Health Commission, Research and Evaluation Office

NOTES: Bars with pattern indicate reference group for its specific category; Asterisk (*) denotes where estimate was significantly different compared to reference group within specific category ($p < 0.05$)

Over time, there has been a significant increase in unintentional opioid overdose deaths in Boston overall, with 16.6 deaths per 100,000 residents in 2013 to 35.4 deaths per 100,000 residents in 2016 (Figure 120). By race/ethnicity, there has been a significant increase over

time among White and Latinos during this time period. For Latinos, the mortality rate for unintentional opioid overdoses increased over 200%, from 16.7 deaths per 100,000 residents in 2013 to 50.5 deaths per 100,000 residents – the largest rate of all groups. Mortality rate data by sex can be found in [APPENDIX I](#).

Figure 120. Unintentional Opioid Overdose Mortality Rate, by Boston and Race/Ethnicity, Age-Adjusted Rate per 100,000 Residents 12 Years and Over, 2013-2016

DATA SOURCE: Massachusetts Department of Public Health, Boston resident deaths, 2013-2016

DATA ANALYSIS: Boston Public Health Commission, Research and Evaluation Office

NOTES: Sample size for Black and Latino for 2013 and 2014 are ≤ 20 and rates should be interpreted with caution; Data not shown for Asian due to insufficient sample size; Dashed line indicates reference group for statistical testing done for 2016 data; Asterisk (*) denotes where estimate was significantly different compared to reference group for 2016 data ($p < 0.05$); Change over time was statistically significant for Boston (increase over time), Latino (increase over time), and White (increase over time)

A similar trend to opioids specifically, there was a significant increase for Boston overall and Latino residents specifically in the mortality rate from 2013-2016 in all substance use deaths combined, including alcohol, other drug mortality, and unintentional and intentional overdose or poisoning (Figure 121). Data by sex on substance misuse mortality rates can be found in [APPENDIX I](#), showing a significant increase for both men and women.

Figure 121. Substance Misuse Mortality Rate, by Boston and Race/Ethnicity, Age-Adjusted Rate per 100,000 Residents 12 Years and Over, 2013–2016

DATA SOURCE: Massachusetts Department of Public Health, Boston resident deaths, 2013–2016

DATA ANALYSIS: Boston Public Health Commission, Research and Evaluation Office

NOTES: Substance misuse mortality includes all substance misuse deaths, which includes both alcohol and other drug mortality and intentional overdose/poisoning and dependence/abuse deaths; Sample size for Latino for 2013 is ≤ 20 and rate should be interpreted with caution; Data not shown for Asian due to insufficient sample size; Dashed line indicates reference group for statistical testing done for 2016 data; Asterisk (*) denotes where estimate was significantly different compared to reference group for 2016 data ($p < 0.05$); Change over time was statistically significant for Boston (increase over time), Latino (increase over time), and White (increase over time)

While the previous graph showed that overall substance misuse mortality rate for Boston increased over time and was 56.5 deaths per 100,000 residents in 2016, Figure 122 shows that the substance misuse mortality rate actually significantly decreased over time for Boston when excluding deaths attributed to fentanyl. In 2016, the substance misuse mortality rate for Boston when excluding fentanyl was 26.0 deaths per 100,000. Data also indicate a significant decrease from 2013 to 2016 among Black residents in their substance misuse mortality rate when excluding fentanyl. A similar significant decrease was seen in the mortality rate among men, which is presented in [APPENDIX I](#).

Figure 122. Substance Misuse (Excluding Fentanyl) Mortality Rate, by Boston and Race/Ethnicity, Age-Adjusted Rate per 100,000 Residents 12 Years and Over, 2013–2016

DATA ANALYSIS: Boston Public Health Commission, Research and Evaluation Office

NOTES: Sample size for Latino for 2013, 2014, and 2015 are ≤ 20 and rate should be interpreted with caution; Data not shown for Asian due to insufficient sample size; Dashed line indicates reference group for statistical testing done for 2016 data; Asterisk (*) denotes where estimate was significantly different compared to reference group for 2016 data ($p < 0.05$); Change over time was statistically significant for Boston (increase over time), Latino (increase over time), and White (increase over time)

Treatment Service Utilization and Barriers

Of the 100 people (4.2%) completing the Boston CHNA survey who indicated that they needed substance use treatment or services at some point, 22% reported that they could not access the substance use services that they needed. Barriers to substance use treatment was discussed by the focus group participants in recovery and a few interviewees. These participants discussed the need for more affordable inpatient and outpatient treatment options, especially for non-English speakers. Long-term support services like sober houses were identified as limited and expensive, with one key informant sharing, *“I can get someone into detox, but what we don’t have enough of is a place for them to get to the next step [of sobriety].”* Focus group participants in recovery also reported that cost was a barrier to treatment. There was a perception that insurance companies only covered certain substances. One focus group participant from the South End shared, *“You have to be addicted to a certain drug to get help. My insurance only covers help to get clean from heroin.”*

Further, the need for culturally-competent treatment options was also discussed as a challenge by key informants. One illustrated these barriers by sharing, *“There is far too little access to treatment programs, and those that do exist are not linguistically and culturally competent.”* For example, shared the interviewee, it was common some cultures to be averse to group approaches to care. One explained, *“Even when the organization convinces a young person to enroll in a treatment program, that young person will leave as soon as they are asked to participate in group-based therapy because that’s not something they are culturally comfortable with. If treatment programs had more bilingual and bicultural staff, they would be able to tailor programs to Asian youth and help them actually make progress in their recovery.”*

Figure 123 shows that in 2017, there were 129.1 unique substance abuse treatment admissions per 10,000 Boston residents 12 years old and over, which is significantly lower than the rate of admissions in 2011 (142.4 admissions per 10,000 Boston residents 12 years old and over).

Figure 123. Unique Substance Abuse Treatment Admission Rate, by Boston and Over Time, Age-Adjusted Rate per 10,000 Residents Aged 12+ Years, 2011-2017

DATA SOURCE: Massachusetts Department of Public Health, Substance Abuse Services, 2011-2017

DATA ANALYSIS: Boston Public Health Commission, Research and Evaluation Office

NOTES: Data represent treatment admissions for unique individuals; Change over time was statistically significant (decrease over time)

The rate of alcohol treatment admissions for Boston overall was 71.9 treatment admissions per 10,000 residents 12 years and over (Figure 124). Compared to White residents (78.1 treatment admissions per 10,000 residents 12 years and over), Black residents had a higher treatment admission rate for alcohol (91.7 treatment admissions per 10,000 residents 12 years and over), whereas Asian and Latino residents had lower treatment admission rates for alcohol (6.7 treatment admissions per 10,000 residents 12 years and over and 64.2 treatment admissions per 10,000 residents 12 years and over, respectively). The rate for females was lower compared to that for males. Over time, the rate of treatment admissions in 2017 was significantly lower than that in 2011 (data in [APPENDIX I](#)).

Figure 124. Unique Alcohol Abuse Treatment Admission Rate, by Boston and Selected Indicators, Age Adjusted Rate per 10,000 Residents, 2015–2017 Combined

DATA SOURCE: Massachusetts Department of Public Health, Substance Abuse Services, 2015–2017

DATA ANALYSIS: Boston Public Health Commission, Research and Evaluation Office

NOTES: Data include admissions where alcohol was the primary, secondary, or tertiary drug; Bars with pattern indicate reference group for its specific category; Asterisk (*) denotes where estimate was significantly different compared to reference group within specific category ($p < 0.05$)

For marijuana treatment admissions, as shown in the appendix, the rate of treatment admissions for Boston was 24.5 treatment admissions per 10,000 residents 12 years and over. Similar to alcohol treatment admissions, the rate was higher for Black residents compared to White residents (42.0 treatment admissions per 10,000 residents 12 years and over and 20.5 treatment admissions per 10,000 residents 12 years and over, respectively). Over time, the rate of treatment admissions in 2017 was significantly lower than that in 2011 (see data in [APPENDIX I](#)).

Treatment admissions for heroin occurred at the rate of 67.6 treatment admissions per 10,000 residents 12 years and over in Boston, as shown in Figure 125. Unlike treatment admissions for alcohol and marijuana, when compared to White residents (87.5 treatment admissions per 10,000 residents 12 years and over), Black residents were less likely to be admitted for treatment for heroin (41.4 treatment admissions per 10,000 residents 12 years and over). Asian and Latino residents also saw lower rates of treatment admission for heroin compared to White residents.

Figure 125. Unique Heroin Abuse Treatment Admission Rate, by Boston and Selected Indicators, Age Adjusted Rate per 10,000 Residents, 2015-2017 Combined

Violence and Trauma

Why is This Important?

Violence and trauma are important public health issues affecting physical and mental health. People can be exposed to violence in many ways: they may be victims and suffer from premature death or injuries or witness or hear about crime and violence in their community, which can lead to trauma and other mental distress and reduced quality of life.⁶⁵ Children and adolescents exposed to violence may experience behavioral problems, depression, anxiety, and post-traumatic stress disorder or show increased signs of aggression; research has also shown violence and trauma are linked to health conditions such as high blood pressure, worse cardiovascular health, immune deficiency and sleep problems.⁶⁶

Key Findings in This Section

“It’s dangerous to walk around my neighborhood; I could be sitting on my porch and see fights, car accidents...it’s just not a safe neighborhood for kids.” — Focus group participant

Violence and trauma were frequent concerns reported by focus group and interview participants. Many focus group members expressed concern about personal safety in their communities, with persons of color and children noted to be disproportionately affected. One quarter of respondents to the CHNA community survey described their neighborhoods as unsafe or extremely unsafe. Black and Latino respondents were more likely than other respondents to describe their communities this way. Intimate partner violence was mentioned in focus groups and interviews, with women of color and non-English speaking immigrants identifies as particularly vulnerable. Exposure of children and youth to unhealthy relationships and violence (adverse childhood experiences) is also of concern: nearly one in five Boston adults reported experiencing one adverse experience over their lifetime, and one in six reported more than one.

Trauma, poverty and, more recently, fear of deportation and family separation is a growing issue. Bullying among youth in Boston has declined over the past few years, although currently one in ten Boston high school students reported that they have been bullied on school property over the past year or have been bullied electronically. Female and LGBTQ students are disproportionately affected by bullying.

Overall Experiences with Violence

Across geographies—violence and trauma were frequent concerns reported by focus group and interview participants. Violence can be experienced in many ways—community violence, family violence, partner violence, sexual violence, and interpersonal violence are some of the most common forms. The BBRFSS asked respondents whether they have ever experienced physical or sexual violence in their lifetime. In data aggregated across 2013-2017, 13% of Boston adults reported experiencing violence in their lifetime (Figure 128). Respondents who identified as female, 35-49 years of age, 50-65 years of age, residents of the Boston Housing Authority, renters or tenants receiving housing assistance, and LGBTQ-identified respondents were significantly more likely than their counterparts to report experiencing violence in their lifetime. By comparison, Asian residents, high school graduates, and immigrants living in the US for less than ten years were less likely to report an experience of violence in their life course. However, it should be noted that given the nature of the question, responses may be underreported overall and within some population groups.

Figure 128. Percent Adults Reporting Experiencing Violence in Lifetime, by Boston and Selected Indicators, 2013, 2015, and 2017 Combined

NOTES: Bars with pattern indicate reference group for its specific category; Asterisk (*) denotes where estimate was significantly different compared to reference group within specific category ($p < 0.05$); Error bars show 95% confidence interval

Residents of Allston/Brighton (20%) were more likely than the rest of Boston to report experiencing violence in their lifetime, while residents in Back Bay (9%), Fenway (8%), Hyde Park (10%), and West Roxbury (8%) were less likely to report violence in their lifetime (Figure 129).

DATA ANALYSIS: Boston Public Health Commission, Research and Evaluation Office

NOTE: Asterisk (*) denotes where neighborhood estimate was significantly different compared to the rest of Boston ($p < 0.05$); Error bars show 95% confidence interval

Community Violence

Community violence was the most frequently discussed type of violence in focus groups, namely in the neighborhoods of Dorchester, Mattapan, Roxbury, Chinatown, and East Boston. English and non-English speaking residents alike reported concerns about personal safety in their communities. Participants who identified as parents commonly discussed concerns of the impacts of violence on young people. Violence-based trauma emerged as a key health issue affecting many population groups, particularly young children and communities of color. Several interview participants expressed the need to better understand how systemic issues such as racism and other forms of oppression impact trauma in communities of color.

Across all language groups, many focus group participants reported concerns about personal safety in their communities. Key informants and focus group participants specifically mentioned that children and communities of color are disproportionately impacted by violence. Other marginalized groups that were mentioned by key informant and focus group assessment participants include: LGBTQ youth—especially those who identify as transgender or non-binary; seniors; and immigrants. Further, community residents and interviewees alike stressed that community violence needs to be addressed from a lens of collective trauma. One Dorchester resident shared, “*Our community is suffering from PTSD. We need to heal these wounds...kids have to walk by places where people they loved have been killed.*”

Some LGBTQ youth who participated in focus groups described their neighborhoods as “very violent” with one sharing, “*It’s dangerous to walk around my neighborhood; I could be sitting on my porch and see fights, car accidents...it’s just not a safe neighborhood for kids.*” In Chinatown, there was a perception that the proximity to homeless shelters were adding to the violence in the community. One Chinese-speaking focus group participant shared, “*The [homeless] shelters are very close to Chinatown and near the banks. Many residents are afraid to get robbed there.*”

Another focus group participant agreed and added, *“If they moved the homeless shelter that would help lower crime in our community and in the subway stations.”* Focus group participants and interviewees from Dorchester most frequently cited concerns about increasing gun violence in their communities. One key informant explained, *“A lot of families are experiencing sudden death because of gun violence; it’s traumatizing and de-stabilizing to the community.”*

Some residents in East Boston reported a decrease in violence in recent years; still, East Boston was described as an area that needed more violence prevention supports. In Mattapan, Haitian focus group participants perceived that more Haitian youth were involved in gangs and the criminal justice system. One participant shared, *“Social delinquency was less in the Haitian community; now there are a lot of young Haitian men in prison.”* Other participants agreed with this sentiment and added that certain neighborhoods like Mattapan have reputations for community violence. *“Mattapan has the nickname MurderPan...even some newspapers call it that.”*

When Boston CHNA survey respondents were asked how safe from crime they considered their neighborhood to be, 25% described their neighborhood as unsafe or extremely unsafe. Survey respondents who identified as Black (40%) or Latino (37%), respondents with some college or a certificate program (39%), and parents of children younger than 18 years of age (32%) were more likely to characterize their neighborhoods as unsafe or extremely unsafe (Figure 130).

Figure 130. Percent Boston CHNA Survey Respondents Reporting Considering Their Neighborhood Unsafe or Extremely Unsafe, by All Respondents and Selected Indicators, 2019

DATA SOURCE: Boston CHNA Community Survey, 2019

NOTE: Chi-square analyses were conducted and there were statistically significant differences within the following groups ($p < 0.05$): race/ethnicity, age, gender identity, educational attainment, and parent status

Approximately half of respondents from Roxbury (50%), Mattapan (49%), and Dorchester (45%) described their neighborhood as unsafe or extremely unsafe, a prevalence that was more than double that all survey respondents (25%) (Figure 131).

Figure 131. Percent Boston CHNA Survey Respondents Reporting Considering Their Neighborhood Unsafe or Extremely Unsafe, by All Respondents and Selected Neighborhoods, 2019

DATA SOURCE: Boston CHNA Community Survey, 2019

One in five Boston CHNA survey respondents described gunshots in the neighborhood (22%) and feeling unsafe when along on the street at night (19%) as serious problems (Figure 132). Almost half of respondents reported as a minor or serious problem feeling unsafe in public spaces in their neighborhood (49%) or while riding a bike in their neighborhood (46%).

Figure 132. Percent Boston CHNA Survey Respondents Reporting Perceptions of Safety Issues in Past 12 Months, 2019

DATA SOURCE: Boston CHNA Community Survey, 2019

NOTE: Percentage calculations do not include respondents who responded “not applicable/don’t know”

More detailed data on these questions by different sub-populations can be found in [APPENDIX I](#). Overall, CHNA survey respondents who identified as Latino, younger respondents, parents of young children, and respondents with less than a college education were more likely to report as a serious problem feeling unsafe while alone on their street at night. Additionally, female respondents were more likely than male respondents to cite feeling unsafe while alone on their street at night as a minor or serious.

Boston CHNA survey respondents from Roxbury (31%), Dorchester (28%) were more likely than residents in other neighborhoods to report feeling unsafe when alone in their street at night as a serious problem. Respondents from Mattapan (43%) and Dorchester (36%) were more likely to cite gunshots in their neighborhood over the past year as a serious problem compared to respondents in other Boston neighborhoods.

Consistent with the patterns of inequities across Boston, firearm injuries—emergency department visits and deaths—significantly differs by neighborhood. Dorchester (02121, 02125) and (02122, 02124), Mattapan, Roxbury, and South End had significantly higher rates of nonfatal firearm related emergency department visits compared to the rest of Boston (Figure 133). As shown in Figure 134, the homicide by firearm rate was highest in Dorchester (13.7 and 10.6 homicides per 100,000 residents), Mattapan (9.4 homicides per 100,000 residents), and Roxbury (7.3 homicides per 100,000 residents) in 2011-2016, a rate that was significantly higher than the rest of Boston. The homicide by firearm rate in Allston/Brighton (0.8 homicides per 100,000 residents) was significantly lower than the rest of Boston.

Figure 133. Nonfatal Firearm Related Emergency Department Visit Rate, by Boston and Neighborhood, Age-Adjusted Rate per 100,000 Residents, 2013–2017 Combined

Community Policing

When discussing community violence, focus group and interview participants also commented about the police and the various approaches they took in their neighborhoods. There were mixed perceptions of relations with law enforcement among focus group and interview participants. Some interviewees and focus group participants—namely those from communities of color—perceived that their communities were being overpoliced. One key informant summarized, “*There is a history of over policing and police violence among people of color in [Boston].*” Further, some key informants spoke of the increase of anti-police sentiments across the country and perceived that these sentiments made positive community-police relations a challenge.

Focus group participants in East Boston reported an increase in law enforcement presence in their neighborhood, which they mentioned as a strength and some attributed to declining levels of violence. They shared, “*There used to be a lot of violence in the community, but it has been better in the last two years. The police have been doing sweeps in the neighborhoods and have caught a lot of people, mainly adolescents.*” On the contrary, key informants representing Chinatown perceived a decrease presence of law enforcement, one sharing, “*There are not as many BPD officers walking through the [Chinatown] community on foot as there use to be, interacting face-to-face with community members. Now, officers tend to drive around instead of walking...*” It was noted by some key informants that the Boston Police Department has made positive strides to improve community relations by focusing on youth engagement, hosting community dialogues, and strengthening partnerships across sectors.

Interpersonal and Domestic Violence

The prevalence of interpersonal violence—a pattern or behavioral used to establish power and control over another person through fear and intimidation, often including the threat or use of violence—was discussed by a few key informants and by some focus group participants from

Chinatown, East Boston, and Mattapan. One key informant explained, *“There are plenty of families who are dealing with abusive relationships...there is evidence of abuse, domestic violence, drug addiction.”* Women of color and non-English speaking immigrants were identified as especially vulnerable to interpersonal and domestic violence due to cultural or linguistic barriers. One resident from Mattapan shared, *“Sometimes in the Haitian community, we are scared to address abuse. There needs to be more education about women’s rights to address domestic violence; not only the physical, but the verbal and mental.”* The need for more service providers who were bi-lingual was described as a priority among these groups. One key informant explained, *“[I] would like to see [health care institutions] to employ more Asian people, especially immigrants and bilingual people, not only as medical providers, but as administrative and other staff, like custodians, greeters, accountants, security personnel, food service workers, technicians, etc.”*

Further, there was a perception that it was common for young people to be exposed to unhealthy relationships. One key informant shared, *“Men are seen as having dominion over their home and family, and women are expected to defer to his wishes and seek his permission to do certain things; youth today see that and therefore believe it’s right for men to be in charge and for women to obey. This is why dating violence and domestic violence continues to be a challenge in Chinatown, and why it’s not considered a big deal.”* Another non-English focus group participant in East Boston expressed concerns related to domestic violence in immigrant communities, sharing, *“Marriage and divorce are very difficult- there are a lot of people marrying because of necessity, even if it’s not the healthiest situation.”*

There is very little quantitative data available on interpersonal or domestic violence. In 2018, the Boston Police Department served a total of 1,921 restraining orders. Table 25 shows the distribution of these by neighborhood.

Table 25. Number of Restraining Orders Served by Boston Police Department, by BPD District, 2018

	Area	Number
A-1	Downtown	19
A-7	East Boston	66
A-15	Charlestown	2
B-2	Roxbury	386
B-3	Mattapan	368
C-6	South Boston	237
C-11	Dorchester	200
D-4	South End	113
D-14	Brighton	182
E-5	West Roxbury	146
E-13	Jamaica Plain	79
E-18	Hyde Park	123

DATA SOURCE: Courtesy of Boston Police Department, 2018

Adverse Childhood Experiences (ACEs)

Among focus group and interview participants, children were identified as being the most vulnerable to violence exposure, especially for younger children. One key informant summarized, *“You have 1st graders showing up to school hungry, sometimes experience violence in the home; students apologizing for being late because there was a killing and their street was on lock down. They’re dysregulated and traumatized.”*

There was a perception among key informants and focus group participants who identified as parents that there is a lack of resources for children who have experienced traumatic events. This was especially prominent in focus groups in Dorchester, who cited inequitable social emotional supports in lower income schools of color. One shared, *“We need for therapy is schools. When the marathon bomb happened, they blocked off all the streets until they caught him and after, all those kids got counseling. But that type of response only happens when you’re in White schools. Even when the student was shot in front of the [Dorchester] high school in front of hundreds of students they didn’t bring in any therapists and kids are walking by the scene every single day being reminded of it.”*

In 2017, nearly one in five Boston adults reported experiencing one adverse childhood experience (19%) over their life time (Figure 136). Nearly one in six Boston residents reported more than one adverse childhood experience (16%).

Figure 136. Percent Adults Reporting Adverse Childhood Experiences (ACEs) For Themselves, by Boston, 2017

DATA SOURCE: Boston Public Health Commission, Boston Behavioral Risk Factor Surveillance System, 2017

DATA ANALYSIS: Boston Public Health Commission, Research and Evaluation Office

NOTE: The Adverse Childhood Experiences (ACE) questions were asked of Boston adult residents to assess associations between childhood maltreatment, and health and well-being later in life; In 2017, residents were asked 4 of the 10 questions from the original ACE module created by the Center for Disease Control (CDC); Residents participating in the survey were asked: 1) if they ever lived with a caregiver who was depressed, mentally ill, or suicidal; 2) if they ever lived with a caregiver who was a problem drinker or alcoholic, or someone who abused drugs 3) if their parents were ever physically violent towards each other and 4) if they ever lived with a caregiver who had been in prison.

In 2013-2017, one in six Boston adults (17%) reported having lived with a caregiver with a mental illness as a child (Figure 137). Adults who identified as female, renters receiving assistance, renters not receiving assistance, and LGBTQ respondents were significantly more likely than their counterparts to report having lived with a caregiver with a mental illness during their childhood.

Figure 137. Percent Adults Reporting Having Lived with a Caregiver with Mental Illness as a Child (ACE), by Boston and Selected Indicators, 2013, 2015, 2017 Combined

NOTES: Bars with pattern indicate reference group for its specific category; Asterisk (*) denotes where estimate was significantly different compared to reference group within specific category ($p < 0.05$); Error bars show 95% confidence interval

Nearly one-quarter of residents of Allston/Brighton (24%) reported living with a caregiver with a mental illness as a child, a prevalence that significantly exceeded the rest of Boston (Figure 138). Residents in Fenway (10%) were significantly less likely to report living with a caregiver with a mental illness as a child.

Figure 138. Percent Adults Reporting Having Lived with a Caregiver with Mental Illness as a Child (ACE), by Boston and Neighborhood, 2013, 2015, 2017 Combined

DATA ANALYSIS: Boston Public Health Commission, Research and Evaluation Office

NOTE: Asterisk (*) denotes where neighborhood estimate was significantly different compared to the rest of Boston ($p < 0.05$); Error bars show 95% confidence interval

As shown in Figure 139, 18% of Boston adults reported having lived with a caregiver with substance misuse. In 2013-2017, adults who identified as renters, LGBTQ, earning <\$25,000, or out of work were significantly more likely to report having lived with a caregiver with substance misuse compared to their counterparts.

NOTES: Bars with pattern indicate reference group for its specific category; Asterisk (*) denotes where estimate was significantly different compared to reference group within specific category ($p < 0.05$); Error bars show 95% confidence interval

As shown in Figure 140, approximately one in six Boston adults (17%) reported having lived with adults who physically abused each other when they were children. Reports of living in environments during childhood where adults abused each other were significantly more common among adults who identified as Black or Latino, Boston Housing Authority residents, renters, adults with a high school education or less, LGBTQ adults, residents earning <\$25,000, and adults who were out of work compared to their counterparts in 2013-2017.

In 2017, 8% of Boston adults reported having lived with someone who had been in prison during their childhood (Figure 142). Black adults (12%), adults living in Boston Housing Authority units (12%), renters receiving rental assistance (13%), adults with less than a high school education (13%), and adults earning <\$25,000 (12%) were significantly more likely than their peers to have lived with someone who had been imprisoned during their childhood.

When asked about adverse childhood experiences, 35% of Boston CHNA survey respondents reported experiencing financial strife somewhat often or very often during their childhood (Figure 143). One in six respondents (17%) reported experiencing a parental divorce or separation during childhood.

NOTE: Percentage calculations do not include respondents who responded “don’t know”

Bullying

Approximately one in ten Boston high school students (12%) reported being bullied on school property in the past year (Figure 144). Female students (13%) and LGBTQ students (18%) were significantly more likely to report an experience of bullying at school, while Asian students (8%) were significantly less likely to report an experience of being bullied at school in the past year.

NOTES: Students were asked if during the past 12 months they had been bullied on school property; Error bars show 95% confidence interval; Change over time was statistically significant (decrease over time)

In 2013-2017, 9% of Boston high school students reported being bullied electronically in the past year (Figure 146). Female (11%) and LGBTQ students (16%) were significantly more likely than their counterparts to report experiences of electronic bullying. Female students of color were significantly less likely to report electronic bullying than White female students.

Figure 146. Percent Boston Public High School Youth Reporting Being Electronically Bullied in the Past Year, by Boston and Selected Indicators, 2013, 2015, and 2017 Combined

In 2013-2017, 7% of Boston high school students reported being bullied in the past year because of their sexual orientation (Figure 147). Nearly one in five (19%) LGBTQ high school students reported this form of bullying, which was significantly higher than bullying due to sexual orientation reported by their straight and non-transgender peers (5%) over the same period. Rates for this indicator have remained steady over the last several years ([APPENDIX I](#)).

Trauma

The impacts of trauma greatly affect health outcomes for youth and adults. Different facets of trauma were described by assessment participants. For example, some key informants discussed the trauma of poverty that results in chronic stress and post-traumatic stress disorder. The topic of intergenerational trauma was also described as a concern by key informants with experience in early childhood education. These interviewees explained that trauma is cyclical, with one sharing, *“trauma is generational; parents and their parents before them are living in unstable housing, are being evicted...”*. Further, numerous key informants mentioned the trauma experienced by immigrant children and their families, and cited fear of deportation and family separation.

A common theme that emerged in focus group and interviews was the need to integrate more trauma-informed care in health services and early childhood education. Focus group participants who identified as survivors of violence expressed the need for more accessible services, sharing, *“We need trauma-informed classes that are in our neighborhoods [Dorchester]. I want my kids to know that their feelings are valid and real...that it's okay to be scared.”* Suggestions were made by key informants to invest in community-driven solutions that meaningfully engage young people. According to key informants, meaningful engagement of youth needs to happen on a structural level, one sharing: *“We need to talk to young people.”*

There are times that we consider meaningful youth engagement where we let them pick the color of a t-shirt. If we want to meaningfully engage youth in anti-violence work, we need to hold meetings at times when they're available, pay them for their expertise, and commit resources for them in our budgets."

Widening the trauma-informed care lens by focusing on familial responses to trauma emerged as a theme from key informant interviews. Other suggestions included strengthening the foundation of trust with community residents by addressing trauma from a community-driven, grassroots, perspective. One key informant shared, *"We need to get people involved in in the process of developing strategies to address trauma, using the consumer model of asking people what they need; approaching one household at a time."* There were also suggestions to expand neighborhood trauma teams and strengthen partnerships that bring interdisciplinary groups together. One interviewee suggested creating a community review board before implementing new initiatives, a *"population version of an IRB [institutional review board]."*

Institutional Racism

Institutional racism—or the systematic distribution of resources, power, and opportunity in our society to the benefit of people who are White and the exclusion of people of color—was described as a priority by several key informants and focus group participants. As one interviewee summarized, *"We see things in communities of color like over policing, greater system involvement, more suspensions, the school to prison pipeline...racism shows up in all of these insidious ways."* Similarly, one focus group participant in Dorchester shared, *"If the rules are made by White people **for** White people, it doesn't matter who is elected to represent us; nothing will change for us [Black residents]."*

Key informants identified a need for more structural commitments to anti-racism work including investments in staff training, sharing, *"We need to make anti-racism work part of what we do...it matters. We need to have all levels of folks engaging in these conversations."* One example that was identified as a meaningful structural commitment to anti-racism was the Boston Public Health Commission's mandatory anti-racism training for employees. One key informant shared, *"I think we continue to need an honest reckoning with the impact that systems-based violence and racism going on; accepting the personal roles we play as White people. I don't think we have the tools or resources to address system-based violence and racism in a real and concrete actionable way."*

Maternal and Child Health

Why is This Important?

The health and well-being of mothers, infants, and children are important indicators of community health. Their well-being determines the health of the next generation and can help predict future public health challenges for families, communities, and the health care system.⁶⁷ Understanding the current status of and disparities within infant mortality rates, low birthweight and preterm births, and access to prenatal care, is important to predict infant survival, child development, and well-being as well as potential health care resources needed and costs of care.⁶⁸ Infants born prematurely, for example, are at risk for neurological disabilities, respiratory conditions, or developmental delays.⁶⁹

Key Findings in This Section

“People are always working and giving all of their money to child care. I’m working my life away to pay someone else to take care of my children.” — Focus group participant

Quantitative data indicate that the overall birth rate in Boston has significantly declined for women 15-44 years old since 2011 to 41.6 births per 1,000 female residents in 2017. However, current birth rates are significantly different by neighborhood with Hyde Park, Charlestown, Roslindale, Mattapan, East Boston, Dorchester, and West Roxbury were neighborhoods having significantly higher birth rates. Relative to other cities in the United States, rates of infant mortality are low and have been relatively stable over time but are higher in some neighborhoods. Rates of infants with low birthweight and preterm births—both important risk factors for infants—are less than 10% and have generally remained steady from 2011-2017. However, rates for both are significantly higher among Black and Latino mothers. Smoking among pregnant women, another risk factor for poorer birth outcomes, has also declined in recent years. Access to prenatal care has improved over time, and currently more than eight in ten mothers in Boston receive adequate or adequate plus prenatal care. However, Asian, Black, and Latino mothers are significantly less likely than White mothers to receive adequate or adequate plus prenatal care. Focus group members and interviewees tended to discuss maternal and child health in the context of economics and parenting concerns. Childcare was frequently discussed, with expensive or inconvenient childcare, long waitlists, and lack of summer childcare as primary issues. Difficulty paying for childcare was also an issue for respondents to the Boston CHNA community survey.

Perceptions of Parenting and Child Health

It was not common for focus group or interview participants to name maternal or child health conditions, per se, as a top concern. Instead, discussions around this topic centered on the economic concerns about raising a family, financial costs of child care, and appropriate parent practices. Mothers from East Boston who participated in focus groups specifically described the challenging demands of raising children and reported that some women are pressured to conceive even if it is not in their best interest. One participant shared, *“I know a woman who has 3 kids and is barely able to get by, but her husband wants more kids and she doesn’t. It’s easy for them to say but it’s not their lives and body they’re sacrificing.”*

A common theme that emerged among focus group with parents—many of whom identified as single mothers—was the need for more supports to learn positive parenting skills. Some attributed the demands of working long hours as interfering with a parent’s ability to spend quality time with their children. Participants indicated that lack of time often results in behavioral issues in children. One parent summarized, *“Families are so focused on working to provide for their kids, but what kids really need is time with their parents.”*

Discipline practices were also discussed in focus group groups, with some participants indicating that cultural norms in parenting differ among population groups. For example, focus group participants in Dorchester expressed the need to break generational practices that some perceived as detrimental to children. One shared, *“Everything I learned as a parent I learned*

from other women and it wasn't always right. Now I'm finally figure out how to be a good parent but my youngest is 16 now. They're gone through so much stuff before I figured out what it means to be a good parent." Immigrant parents in East Boston, Mattapan, and Allston/Brighton described cultural differences in parenting between generations that they perceived as often creating tension between children and parents. One focus group participant shared, *"We come from different cultures and in America it's different. American culture doesn't emphasize respecting elders or devotion to the group; it's all about the individual doing whatever they want with no consequence."* Another parent agreed and expanded, *"We would have never spoken to our parents the way our kids speak to us; my daughter says she's just expressing herself, but that behavior is not okay in my country."*

Access and Barriers to Childcare

Surveillance data on the availability and access to child care are scant in Boston. To address this gap, the City of Boston is in the process of collecting data through an optional survey on the 2019 city census on residents' language, disability access, child status, and current situation and barriers to child care for children five years old and younger.

For low-income working families, the cost of childcare was described as a substantial barrier to financial security and employment opportunities, especially for single parents. One interviewee summarized, *"The availability and affordability of childcare, especially for single parents where the vast majority are female-headed households, is almost impossible."* Focus group participants in East Boston and Dorchester described the need to work multiple jobs in order to afford childcare, which impacted their ability to be an engaged in their child's life. One mother explained, *"People are always working and giving all of their money to child care. I'm working my life away to pay someone else to take care of my children."* Key informants reported that children ages 0-5 were especially vulnerable to the long-standing impacts of poverty. One shared, *"Young children 0-5 are the most vulnerable in the city. With [poverty] comes trauma related issues just by virtue of their families being in a low- or lower-income status."* Among Boston CHNA survey respondents, nearly one-quarter (23.1%) of parents of children under 18 years old indicated that they had trouble paying for child care.

Unaffordable and inconvenient childcare was mentioned as a significant concern amongst focus group participants. As one focus group participant remarked, *"People are always working and giving all of their money to child care. I'm working my life away to pay someone else to take care of my children,"* a sentiment felt by many participants. The cost of child care was a major financial challenge for parents. However, not only was cost identified as a barrier for parents, but key informants also described long waitlists for childcare, especially for younger children who are under the age of 3 years old.

Key informants who identified as parents also expressed that childcare was especially difficult during the summer time and on school breaks. One shared, *"[Childcare especially bad in the summertime. I want my grandkid to be able to go to the Boys and Girls Club to be with other kids, but even that is \$200 a week; I barely make that much."* Additionally, focus group participants who identified as grandparents in Dorchester frequently spoke of needing to help their children with childcare, often causing them to miss work. One resident shared, *"I have to watch my grandson because every Friday it's a half a day at school, and every month or so there's a day when they don't go. My daughter is trying to work to make a life for herself but how*

can she when she has to leave to get him at school in the middle of the day? So, I'm trying to help my daughter by taking care of him at those times, but it means that I can't work."

Survey data confirm these themes. Of the Boston CHNA survey respondents, almost 11% indicated that they had trouble paying for child care. Data by race/ethnicity show that 16% of Latino respondents and 14% of Black respondents report trouble paying for child care (Figure 148). While the numbers were generally small in the survey among some non-English speakers so results should be interpreted with caution, Figure 149 indicates that Haitian Creole, Portuguese, and Spanish speakers were significantly more likely than the rest of the sample to indicate having trouble paying for child care.

Figure 148. Percent Boston CHNA Survey Respondents Reporting Having Trouble Paying for Child Care, by All Respondents and Selected Indicators, 2019

DATA SOURCE: Boston CHNA Community Survey, 2019

NOTE: Chi-square analyses were conducted and there were statistically significant differences within the following groups ($p < 0.05$): race/ethnicity, age, educational attainment, and parent status

Figure 149. Percent Boston CHNA Survey Respondents Reporting Having Trouble Paying for Child Care, by All Respondents and Primary Language Spoken, 2019

DATA SOURCE: Boston CHNA Community Survey, 2019

Birth Rate and Birth Risk Factors

The overall birth rate in Boston has significantly declined for women 15-44 years old since 2011 from 45.1 births per 1,000 female residents to 41.6 births in 2017. Data can be found in the [APPENDIX I](#). However, current birth rates are significantly different by neighborhood. Hyde Park, Charlestown, Roslindale, Mattapan, East Boston, Dorchester, and West Roxbury were neighborhoods with significantly higher birth rates in 2017 compared to the rest of Boston (Figure 150). Additional data on birth rates by race/ethnicity and age group can be found in [APPENDIX I](#).

Figure 150. Birth Rate, by Boston and Neighborhood, Age-Specific Rate per 1,000 Female Residents Aged 15-44 Years, 2017

DATA SOURCE: Massachusetts Department of Public Health, Boston Resident Live Births, 2017

DATA ANALYSIS: Boston Public Health Commission, Research and Evaluation Office

NOTES: Asterisk (*) denotes where neighborhood estimate was significantly different compared to the rest of Boston ($p < 0.05$)

Low birthweight (born less than 5 lbs., 8 oz.) and preterm births (born less than 37 weeks gestation) are both important risk factors for infants. The percentage of babies born low birth weight or preterm have generally remained steady from 2011-2017 (data in [APPENDIX I](#)). In

2017, 8.7% of babies born in Boston were born low birthweight and 9.9% were considered preterm. For both low birth weight and preterm births, rates were significantly higher among Black and Latino mothers (Figure 151). Data for these risk factors by neighborhood and age of mother can be found in [APPENDIX I](#).

Figure 151. Percent Low Birthweight and Preterm Births, by Boston and Race/Ethnicity, 2017

DATA SOURCE: Massachusetts Department of Public Health, Boston Resident Live Births, 2017

DATA ANALYSIS: Boston Public Health Commission, Research and Evaluation Office

NOTES: Low birthweight is defined as weighing less than 5 pounds, 8 ounces; Preterm birth is defined as being born before 37 weeks of gestation; Bars with pattern indicate reference group for its specific category; Asterisk (*) denotes where estimate was significantly different compared to reference group within specific category ($p < 0.05$)

Another risk factor for children is smoking during pregnancy. The percentage of mothers in Boston who reported smoking during pregnancy has significantly decreased over time from 2.2% in 2011 to 1.5% of mothers in 2017 (Figure 152). However, among mothers who do report smoking during pregnancy, it is significantly more likely among those in their 20s compared to those who are 35+ years old, White mothers compared to Latino and Asian mothers (Figure 153), and those living in Dorchester or Roxbury compared to the rest of Boston (Figure 154).

Figure 152. Percent Mothers Who Smoked During Pregnancy, by Boston and Over Time, 2011-2017

DATA SOURCE: Massachusetts Department of Public Health, Boston Resident Live Births, 2011-2017

DATA ANALYSIS: Boston Public Health Commission, Research and Evaluation Office

NOTE: Change over time was statistically significant (decrease over time)

Figure 153. Percent Mothers who Smoked during Pregnancy, by Boston and Selected Indicators, 2015–2017 Combined

DATA ANALYSIS: Boston Public Health Commission, Research and Evaluation Office

NOTES: Asterisk (*) denotes where neighborhood estimate was significantly different compared to the rest of Boston ($p < 0.05$)

Since 2011, the percentage of mothers who have received adequate or adequate plus prenatal care has significantly increased over time (Figure 155), with more than eight in ten mothers in Boston falling into this category in 2017. However, Asian, Black, and Latino mothers were significantly less likely than White mothers to receive adequate or adequate plus prenatal care (Figure 156). Data by mother's age and neighborhood can be found in [APPENDIX I](#).

Figure 155. Percent Mothers Who Received Adequate or Adequate Plus Prenatal Care, by Boston and Over Time, 2011-2017

DATA SOURCE: Massachusetts Department of Public Health, Boston Resident Live Births, 2011-2017

DATA ANALYSIS: Boston Public Health Commission, Research and Evaluation Office

NOTES: According to the Kotelchuck Index for Prenatal Care, adequate prenatal care is defined as having 80-109.9% of expected visits for prenatal care and adequate plus prenatal care is defined as having 110% or more of expected visits; Change over time was statistically significant (increase over time)

Figure 156. Percent Mothers Who Received Adequate or Adequate Plus Care, by Boston and Race/Ethnicity of Mother, 2017

DATA SOURCE: Massachusetts Department of Public Health, Boston Resident Live Births, 2017

DATA ANALYSIS: Boston Public Health Commission, Research and Evaluation Office

NOTES: According to the Kotelchuck Index for Prenatal Care, adequate prenatal care is defined as having 80-109.9% of expected visits for prenatal care and adequate plus prenatal care is defined as having 110% or more of expected visits; Bars with pattern indicate reference group for its specific category; Asterisk (*) denotes where estimate was significantly different compared to reference group within specific category (p < 0.05)

While rates of infant mortality are low and have been relatively stable over time (as shown in [APPENDIX I](#)), the mortality rate of aggregated 2015-2017 data was 5.1 per 1,000 live births (Figure 157). However, infant mortality rates were significantly higher in Hyde Park, South End, Dorchester (02122, 02124), and Mattapan.

Figure 157. Infant Mortality Rate, by Neighborhood, Rate per 1,000 Live Births, 2015–2017 Combined

DATA SOURCE: Massachusetts Department of Public Health, Boston Resident Live Births, 2015–2017 Combined

DATA ANALYSIS: Boston Public Health Commission, Research and Evaluation Office

NOTES: Infant mortality is defined as the death of an infant before 1 year of age; NA denotes where rates are not shown due to insufficient sample size; Sample size for Dorchester (02121, 02125), Dorchester (02122, 02124), East Boston, Fenway, Hyde Park, Mattapan, and South End are <20 & rates should be interpreted with caution; Asterisk (*) denotes where neighborhood estimate was significantly different compared to the rest of Boston ($p < 0.05$)

Childhood Lead Exposure

There is a dearth of health surveillance data available for young children. One health issue where data are regularly collected is around lead exposure. In 2011, 3.9% of boys under 6 years old were screened with elevated blood lead levels, while that figure was 2.4% in 2015 (Figure 158). For girls, 3.0% who were screened had high blood levels; in 2015, that number was 2.2%.

Figure 158. Percent Children Under 6 Years Screened with Elevated Blood Lead Levels in Boston, by Sex and Over Time, 2011–2015

DATA SOURCE: Massachusetts Department of Public Health, Childhood Lead Poisoning Prevention Program, 2011–2015

DATA ANALYSIS: Boston Public Health Commission, Research and Evaluation Office

NOTES: Poisoning defined greater than 5 ug/dl of blood lead level based on the 2012 CDC recommendation of less than 5 ug/dl of lead; Significance testing was not conducted for these data

By neighborhood, the percent of children who were identified as having elevated blood levels among those who were screened ranged from 3.8% of children in Allston/Brighton to 0.9% of children in South Boston and West Roxbury (Figure 159).

Figure 159. Percent Children Under 6 Years Screened with Elevated Blood Lead Levels, by Boston and Neighborhood, 2015

DATA SOURCE: Massachusetts Department of Public Health, Childhood Lead Poisoning Prevention Program, 2015

DATA ANALYSIS: Boston Public Health Commission, Research and Evaluation Office

NOTES: Poisoning defined greater than 5 ug/dl of blood lead level based on the 2012 CDC recommendation of less than 5 ug/dl of lead; †Fenway was reported as having a prevalence of 0%-0.75%; Sample sizes for in Back Bay, Charlestown, Fenway, Mattapan, South Boston, South End and West Roxbury are ≤ 20 and rates should be interpreted with caution; Significance testing was not conducted for these data

A few focus group participants, specifically residents in Allston/Brighton and East Boston, mentioned concerns about lead. Specifically, they talked about the possibility of lead paint in older houses and its potential health effects. As one parent shared, *“Lead in the house worries me; this neighborhood has a lot of old houses and people don’t know that lead is very dangerous.”* A few also commented on concerns of lead in the water in older school buildings.

Sexual Health

Why is This Important?

Sexually transmitted infections (STIs) remain a significant public health problem in the United States, despite the fact that they are preventable. Each year, there are approximately 20 million new STIs—about half of them among young men and women.⁷⁰ While most will not cause harm, some have the potential for serious health consequences including chlamydia, gonorrhea, syphilis and human papillomavirus (HPV). STIs are also costly, accounting for about \$16 billion in total medical costs annually.⁷¹

“[There is a] need for more access to positive sexual health education. Parents don’t feel comfortable discussing sex, so kids’ only exposure is media, where the emphasis is on physical gratification, not on developing positive, respectful relationships with a partner.” — Key informant interviewee

Key Findings in this Section

While sexual health was not a prominent theme discussed across focus groups or interviews; the Youth Risk Behavioral Survey provides helpful insights into sexual behaviors among youth, such as condom use, to inform STI prevention strategies. This is particularly important given that residents age 15-24 experienced the highest rates of chlamydia and gonorrhea. Boston has experienced a significant increase in cases of chlamydia and gonorrhea over time with disparities by neighborhood, age, and sex. While the incidence of HIV among Boston residents has decreased over time, disparities persist by neighborhood, race/ethnicity, age, and sex.

Youth Sexual Activity

Sexual health was not a prominent theme discussed across focus groups or interviews; however, a few key informants with expertise in the field of substance use and early childhood care expressed the need for more sexual health education as early as late elementary and middle school. They described concerns related to social media use and the impacts of unhealthy relationship models.

According to 2013-2017 Youth Risk Behavioral Survey results, 44% of Boston public high school students reported ever having sex and 62% of sexually active Boston public high school students used a condom during the last time they had sex. About half of Latino and Black students had ever had sex (52% and 48%, respectively), which was significantly higher than White students (33%). Latino and Black students were also twice as likely to report having sex before age 13. Nearly two-thirds of students who identified as LGBTQ had ever had sex, which was significantly higher than students who identified as heterosexual/non-transgender (41%); LGBTQ students were also more likely to report having sex before age 13 compared to heterosexual or non-transgender students. (See [APPENDIX I](#) for additional data on youth sexual behavior.)

LGBTQ youth focus group participants perceived that sex work among LGBTQ young people was on the rise, especially for those who were housing insecure or homeless. One LGBTQ youth focus group participant expressed that the practice of sex work is sometimes normalized, which they described as detrimental to young people. *“I spent time as a prostitute and there was little sympathy for me in the older [LGBTQ] community; I don’t think that these behaviors should be passed off [as normal].”*

Chlamydia

From 2015 to 2017, Boston experienced a 21% increase in chlamydia from 638 to 772.5 cases per 100,000 residents. As shown below in Figure 160, Dorchester (02121, 02125) had the highest rate of chlamydia (1,310.0 cases per 100,000 residents) – 1.5 times the rate of the rest of Boston – followed by Roxbury and Dorchester (02122, 02124) (1,070.5 and 1,068.5 cases per 100,000 residents, respectively). Younger residents experienced significantly higher rates of chlamydia compared to residents 40 years and over (161.2 cases per 100,000 residents); those

aged 15-24 years had the highest rate of chlamydia (1,737.8 cases per 100,000 residents). Females had a significantly higher rate of chlamydia compared to males (833.3 and 721.3 cases per 100,000 residents, respectively). See [APPENDIX I](#) for additional data.

Figure 160. Chlamydia Incidence Rate, by Boston and Neighborhood, Age-Specific Rate per 100,000 Residents, 2017

DATA SOURCE: Massachusetts Department of Public Health, Bureau of Infectious Disease and Laboratory Sciences, 2017

DATA ANALYSIS: Boston Public Health Commission, Research and Evaluation Office

NOTES: Data as of 1/1/2019 and data are subject to change; 13% of cases were documented with a Boston residence, but did not have a designated zip code; Asterisk (*) denotes where neighborhood estimate was significantly different compared to the rest of Boston ($p < 0.05$)

Gonorrhea

From 2015 to 2017, Boston experienced a 54% increase in gonorrhea from 160.8 to 247.4 cases per 100,000 residents. The South End had the highest rate of gonorrhea (548.6 cases per 100,000 residents) – 2.2 times the rate of Boston overall – followed by Dorchester (02121, 02125) and Dorchester (02122, 02124) (399.4 and 353.8 cases per 100,000 residents, respectively). The South End, Dorchester (02121, 02125) and (02122, 02124), Jamaica Plain, and Roxbury had significantly higher rates of gonorrhea compared to the rest of Boston. Younger residents experienced significantly higher rates of gonorrhea compared to residents 40 years and over (108.5 cases per 100,000 residents); those aged 30-34 years had the highest rate of gonorrhea (527.3 cases per 100,000 residents). Females had a significantly lower rate of gonorrhea compared to males (114.7 and 394.9 cases per 100,000 residents, respectively). See [APPENDIX I](#) for additional data.

HIV/AIDS

While the incidence of HIV among Boston residents has decreased over time - from 28.7 to 21.8 new diagnoses per 100,000 residents - between 2014-2017, disparities exist by neighborhood, race/ethnicity, age, and sex.

In 2017, Mattapan and Roxbury residents experienced the highest HIV incidence rates (45.0 and 40.1 new HIV diagnoses per 100,000 residents, respectively) across all neighborhoods in Boston (Figure 161).

Figure 161. HIV Incidence Rate by Neighborhood, 2017, Age-Specific Rate per 100,000 Residents, 2017

DATA SOURCE: Massachusetts Department of Public Health, Bureau of Infectious Disease and Laboratory Sciences, HIV/AIDS Surveillance Program, 2017

DATA ANALYSIS: Boston Public Health Commission, Research and Evaluation Office; NOTES: Data as of 1/1/2019 and are subject to change; Data do not include incarcerated individuals; NA denotes where rates are not shown due to insufficient sample size; Asterisk (*) denotes estimate was significantly different compared to the rest of Boston ($p < 0.05$)

Latino and Black residents were also disproportionately affected by HIV with new diagnoses (43.6 and 35.8 per 100,000 residents) at more than three times the rate of White residents (11.0 per 100,000 residents). Adults 35-39 years of age had the highest HIV incidence rate (63.3 new diagnoses per 100,000 residents) – more than three times the rate of adults 40 years and over (19.7 new diagnoses per 100,000 residents) – followed by adults 30-34 years of age (43.3 new diagnoses per 100,000 residents) at more than twice the rate of adults 40 years and over. Females had a significantly lower HIV incidence than males (10.0 and 35.4 new diagnoses per 100,000 residents, respectively) (Figure 162).

Figure 162. HIV Incidence Rate, by Boston and Selected Indicators, Age-Specific Rate per 100,000 Residents, 2017

DATA SOURCE: Massachusetts Department of Public Health, Bureau of Infectious Disease and Laboratory Sciences, HIV/AIDS Surveillance Program, 2017

DATA ANALYSIS: Boston Public Health Commission, Research and Evaluation Office; NOTES: Data as of 1/1/2019 and are subject to change; Data do not include incarcerated individuals; NA denotes where data are suppressed due to insufficient sample size; Asterisk (*) denotes significantly different compared to the rest of Boston ($p < 0.05$); For age stratifications, rates are age-specific rates per 100,000 residents

Quantitative data show that the most frequent mode of HIV transmission in Boston was men who have sex with men (Figure 163). In 2017, nearly half of new HIV diagnoses occurred among men who have sex with men (48%), 31% of new diagnoses were from an unknown mode of transmission, 13% were through presumed heterosexual sex, and 8% were from injection drug use. Some participants in the focus group with residents in recovery or active users perceived an increase in HIV in the community, attributing the increase to needle-sharing and unprotected sex. One resident shared, *“People using that have HIV aren’t getting help; they’re sharing needles and passing the [disease] around/ People are playing Russian Roulette and don’t realize what they’re giving and getting.”* Another resident agreed and added that the perceived rise in methamphetamines were also a factor, sharing, *“There’s an increase in the amount of people getting HIV because of the crystal meth; it keeps you up for days and people fall in love with it. They’ll use anyone’s needles and have unprotected sex, too.”*

Figure 163. Percent New HIV Diagnoses in Boston, by Mode of Transmission, 2017

DATA SOURCE: Massachusetts Department of Public Health, Bureau of Infectious Disease and Laboratory Sciences, HIV/AIDS Surveillance Program, 2017

DATA ANALYSIS: Boston Public Health Commission, Research and Evaluation Office

NOTES: Data as of 1/1/2019 and are subject to change; Data do not include incarcerated individuals

In 2016, the South End had the highest prevalence rate of people living with HIV/AIDS (1,852.1 people per 100,000 residents), followed by Mattapan (1,214.0 people per 100,000 residents), Roxbury (1,181.0 people per 100,000 residents), and Dorchester (02121, 02125) and Dorchester (02122, 02124) (1,102.9 and 1,126.7 people per 100,000 residents) – these rates were significantly higher than those among residents in the rest of Boston (Figure 164).

Figure 164. HIV/AIDS Prevalence Rate, by Boston and Neighborhood, Age-Specific Rate per 100,000 Residents, 2016

DATA SOURCE: Massachusetts Department of Public Health, Bureau of Infectious Disease and Laboratory Sciences, HIV/AIDS Surveillance Program, 2016

DATA ANALYSIS: Boston Public Health Commission, Research and Evaluation Office

NOTES: Data as of 1/1/2019 and are subject to change; Data do not include incarcerated individuals; Asterisk (*) denotes significantly different compared to the rest of Boston ($p < 0.05$)

Black and Latino residents also had significantly higher prevalence rates of people living with HIV/AIDS (1,562.0 and 943.8 people per 100,000 residents, respectively) compared to White residents (670.1 people per 100,000 residents). Females had a significantly lower prevalence rate of people living with HIV/AIDS compared to males (376.6 and 1,367.7 people per 100,000 residents, respectively) (Figure 165).

Figure 165. HIV/AIDS Prevalence Rate, by Boston and Selected Indicators, Age-Specific Rate per 100,000 Residents, 2016

DATA SOURCE: Massachusetts Department of Public Health, Bureau of Infectious Disease and Laboratory Sciences, HIV/AIDS Surveillance Program, 2016

DATA ANALYSIS: Boston Public Health Commission, Research and Evaluation Office

NOTES: Data as of 1/1/2019 and are subject to change; Data do not include incarcerated individuals; Asterisk (*) denotes significantly different compared to the rest of Boston ($p < 0.05$)

From 2011-2017, the HIV/AIDS mortality rate in Boston has been stable and in 2017 was less than 3 deaths per 100,000 residents. However, Black residents experienced a significantly higher rate of death due to HIV/AIDS (6.5 deaths per 100,000 residents) – 2.5 times greater than that of White residents (2.6 deaths per 100,000 residents). See [APPENDIX I](#) for HIV/AIDS mortality data.

Environmental Health

Why is This Important?

“You see those kids playing basketball every day at the Wang Center (YMCA in Chinatown). It’s right by the highway. Think, they are just breathing in all those highway fumes every day...” — **Key informant interviewee**

A healthy environment is associated with a high quality of life and good health. Environmental factors are various and far reaching and include exposure for hazardous substances in the air, water, soil or food; natural disasters and climate change; occupational hazards; and the built environment.^{72,73} An unhealthy environment exacerbates issues of health, illness, injury, and behavior. Hazardous substances in the air and water are connected to health concerns such as cancer and long-term damage to respiratory and cardiovascular systems. Extreme heat, natural disasters such as floods, droughts and storms can cause physical harm, as well as the spread of pollutants, hazardous substances, and communicable diseases.⁷⁴ They also spread environmental health hazards from fires/explosions, toxins, and pollutions. Features of the built environment influence behaviors, physical activity patterns, social networks, and access to resources. Poor environmental quality has its greatest impact on people whose health status is already at risk.⁷⁵

Key Findings in This Section

Concerns related to environmental health were raised across the survey, focus groups, and interviews. Boston CHNA survey respondents cited their top environmental health concerns as: outdoor noise pollution from vehicles, outdoor air pollution from vehicles, and dangerous traffic. Overall, these top three concerns were similar across neighborhoods, except for East Boston which cited airport noise as a top concern. Air pollution and quality was a concern discussed in focus groups in Chinatown and East Boston where residents perceived that lower-income neighborhoods were more vulnerable to pollutants and litter due to proximity to highways, airports, and train stations. BBRFSS data show secondhand smoke exposure was significantly higher among Boston residents of color and lower socioeconomic status.

Multiple key informants explained how more extreme weather, heat, and rising seas from climate change are increasing health problems, particularly for mental health, respiratory, cardiovascular and vector-borne disease. Boston emergency department utilization rates and costs for climate-driven health issues are expected to rise in the future. Community health and resilience efforts can reduce such threats and costs, and help the city prepare for Climate Ready Boston's estimate that 7% of our land will experience frequent storm water flooding by 2050.

Environmental Health Concerns and Experiences

Boston CHNA survey respondents noted a number of different environmental health concerns and whether they experienced any of these concerns at home, work, or school. Among all the issues listed, outdoor noise pollution from vehicles (39.8%), outdoor air pollution from vehicles (38.9%), and dangerous traffic (35.6%) were the top three cited environmental health concerns around a respondent's home (Table 26). Additionally, approximately one-quarter of respondents cited extreme outdoor heat or cold, mold/mildew or water leaks, bug and/or rodent infestation, and more severe storms as top environmental health concerns at home.

At work, the top three concerns were similar but in a different order; dangerous traffic was the most cited environmental health concern with 31.4% reporting this. At respondents' school (if applicable), dangerous traffic, outdoor air pollution from vehicles, inadequate heating or cooling, and outdoor noise pollution from vehicles were the top concerns reported.

Table 26. Percent Boston CHNA Survey Respondents Reporting Environmental Health Concerns at Home, Work, or School, 2019

	Home	Work	School
Outdoor noise pollution from vehicles (N=1,627)	39.8%	21.6%	13.9%
Outdoor air pollution from vehicles (N=1,629)	38.9%	26.2%	15.0%
Dangerous traffic (N=1,639)	35.6%	31.4%	16.6%
Extreme outdoor heat or cold (N=1,586)	29.3%	19.6%	12.7%
Mold/mildew or water leaks (N=1,627)	24.4%	12.1%	8.8%
Bug and/or rodent infestation (N=1,611)	23.8%	13.9%	10.7%
More severe storms (N=1,576)	22.8%	13.8%	7.5%
Inadequate heating and/or cooling (N=1,600)	21.3%	14.0%	14.4%
Airport or airplane noise or vibrations (N=1,590)	20.1%	6.0%	5.0%
Poor indoor air quality (N=1,621)	19.2%	16.3%	9.0%
Tobacco smoke (N=1,627)	17.3%	15.0%	9.3%
Neighborhood flooding (N=1,559)	14.1%	7.6%	4.0%
No or not working smoke detectors (N=1,563)	9.3%	3.1%	3.2%
Industry, toxic waste, pesticides, etc. (N=1,556)	8.9%	8.7%	5.5%
Lead in paint, lead or other contaminants in drinking water (N=2,404)	7.9%	4.3%	7.2%

DATA SOURCE: Boston CHNA Community Survey, 2019

NOTE: Respondents were allowed to select multiple response options; therefore, percentages may not sum to 100%

When looking at these data by respondents' neighborhood of residents, the top three concerns at home were similar across neighborhoods except for a few distinctions (Table 27). East Boston residents' top environmental concern at home was airport or airplane noise or

vibrations, while Mattapan residents cited mold or mildew leaks as a top environmental health concern at home.

When citing environmental health concerns at work, responses were generally similar by respondents' neighborhood of residence, except that Chinatown residents cited tobacco smoke in their top issues (Table 28). When noting top environmental health concerns at school, responses by neighborhood of residence overall mirrored the general sample, except that Hyde Park residents cited bug and/or rodent infestation as their top environmental health issue at school, Roslindale residents cited inadequate heating and/or cooling, and Chinatown residents cited tobacco smoke as their second biggest environmental health concern at school (Table 29). (However, it should be noted that the survey did not ask for respondents' area of work or school.)

Table 27. Percent Boston CHNA Survey Respondents Reporting Environmental Health Concerns at Home, by Neighborhood, 2019

	Allston/ Brighton	Chinatown	Dorchester	East Boston	Hyde Park	Jamaica Plain	Mattapan	Roslindale	Roxbury	South End
1	Outdoor noise pollution from vehicles	Outdoor noise pollution from vehicles	Outdoor air pollution from vehicles	Airport or airplane noise or vibrations	Outdoor air pollution from vehicles	Outdoor air pollution from vehicles	Outdoor noise pollution from vehicles	Outdoor air pollution from vehicles	Outdoor noise pollution from vehicles	Outdoor noise pollution from vehicles

NOTE: N is not presented for each neighborhood in the table due to the Ns varying by each environmental health concern. The Ns are available in the appendix.

Indoor Contaminants

Secondhand smoke can trigger more frequent and severe asthma attacks and respiratory infections, and some studies have associated secondhand smoke exposure to contributing to deaths from coronary heart disease, stroke, and lung cancer. More than one in ten Boston adults reported exposure to secondhand smoke in the BBRFSS questionnaire (Figure 166). Respondents who identified as Asian, Black, or Latino were all significantly more likely than White respondents to report exposure to secondhand smoke. By housing status, non-homeowners were more likely than homeowners to indicate being exposed to secondhand smoke, with more than 20% of Boston Housing Authority residents and renters on rental assistance reporting exposure. It should be noted that in 2012, Boston Housing Authority was among the first large housing authorities in the country to implement a portfolio-wide non-smoking policy. Lower income and unemployed were significantly more likely than their higher income and employed counterparts to report secondhand smoke exposure.

Figure 166. Percent Adults Reporting Secondhand Smoke Exposure in the Home, by Boston and Selected Indicators, 2013, 2015, 2017 Combined

DATA SOURCE: Boston Behavioral Risk Factor Surveillance System (2013, 2015, 2017), Boston Public Health Commission

DATA ANALYSIS: Research and Evaluation Office, Boston Public Health Commission

NOTES: Bars with pattern indicate reference group for its specific category; Asterisk (*) denotes where estimate was significantly different compared to reference group within specific category ($p < 0.05$); Error bars show 95% confidence interval

As noted in the 2016 Health of Boston report, the Environmental and Occupational Health Division of the Boston Public Health Commission responds to requests from the public for inspections related to a broad range of potential environmental health hazards, including mold. These hazards could be in a variety of settings, including private residences, public buildings, workplaces, and outdoor spaces. For 2012-2016, among the inquiries or complaints received, a total of 432 hazards/violations were identified for mold in Boston. Figure 167 shows the number of hazards/violations by neighborhood ranging from 9 in Charlestown to 59 in Dorchester (zip codes 02121, 02125).

Figure 167. Number of Mold Hazards or Violations in Boston, by Neighborhood, 2012-2016

DATA SOURCE: Environmental and Occupational Health Division, Boston Public Health Commission, as cited by Health of Boston (2016-2017), 2012-2016

Outdoor Air Quality and Heat

Concerns related to air pollution were identified specifically in CHNA focus groups Chinatown and East Boston. Residents perceived that lower-income neighborhoods were more vulnerable to pollutants and litter due to proximity to highways, airports, and train stations. As one key informant noted, *“You see those kids playing basketball every day at the Wang Center (YMCA in Chinatown). It’s right by the highway. Think, they are just breathing in all those highway fumes every day. I wonder if years from now what the health effects are going to be. They are trying to get some physical activity playing basketball but end up with worse health because the pollution.”*

East Boston residents reported significant concerns of the addition of an electrical plant in the neighborhood, which they feared would increase cancer rates and respiratory issues. One resident shared, *“The electricity plant is coming and it’s going to make us all sick, my kids will grow up breathing poison.”* Another participant agreed and added, *“Why do they always build the bad in this neighborhood [East Boston]?”*

Air quality was also mentioned in the context of marijuana use in public spaces. Focus group participants in Allston/Brighton, Chinatown, and East Boston frequently mentioned concerns over the legalization of marijuana and the perception that the substance is easily accessible and

often consumed in public spaces, polluting the air around them. One parent shared, *“The park near my house where I take my daughter—there’s a lot of people smoking marijuana all the time.”* Another resident agreed and added, *“Where I live, the people smoke marijuana inside. The smoke makes me choke, my children vomit...but it’s legal [so] what can I do?”*

As noted in the 2016-2016 Health of Boston report, data from the five Massachusetts Department of Environmental Protection (MassDEP) sites located in Boston that monitor particulate matter indicated that there were no years between 2005-2015 when the particulate concentrations exceeded the annual standard set forth by the U.S. Environmental Protection Agency (EPA).⁷⁶

Extreme heat is an additional environmental health concern. Figure 168 shows that for 2016-2017 data combined, the age-adjusted rate per 100,000 residents for heat-related emergency department visits during warm weather months (May-September) was 6.2 visits per 100,000 residents, although men (7.9 visits per 100,000 residents) had significantly higher rates than women (4.8 visits per 100,000 residents). Residents 18-44 years old had significantly lower heat-related ED rates (4.5 visits per 100,000 residents) than residents who were 65+ years old (9.5 visits per 100,000 residents) (Figure 168).

Figure 168. Heat-Related Emergency Department Visits During Warm Weather Months, by Boston and Selected Indicators, Age-Adjusted Rate per 100,000 Residents 2016-2017 Combined

DATA SOURCE: Massachusetts Center for Health Information and Analysis, Acute Hospital Case Mix Databases, 2016-2017 Combined

DATA ANALYSIS: Boston Public Health Commission, Research and Evaluation Office

NOTES: Bars with pattern indicate reference group for its specific category; NA denotes where data are suppressed due to insufficient sample size; Asterisk (*) denotes where estimate was significantly different compared to reference group within specific category (p < 0.05); For age stratifications, rates are age-specific rates per 100,000 residents

Climate Change

The impact of climate change was an issue raised by multiple key informant interviewees who mentioned specific concerns around heat-related illness, warming oceans, infectious disease and displacement. Emerging analysis is expected to show Boston emergency department utilization rates and costs for climate-driven health issues are rising. Interviewees identified the need for a climate-informed emergency preparedness strategy for the city of Boston to address flooding and major heat related-events in the immediate future. One key informant explained, *“We need to draw better connection on the vulnerable populations (outlined by Climate Ready Boston) and emergency response system that targets those neighborhoods so that*

people can get advance notice of when this flooding happens – this area has not really been explored yet...” Key informants described that it is imperative to address climate change through a coordinated and systemic approach. One key informant summarized, “It will be important to mobilize partnerships to address the severity of environmental issues. Hospitals, public health organizations, and others can collaborate to overlay the Climate Ready Boston assessment to prepare high-risk neighborhoods.”

Climate change was also discussed in the context of mental health. Key informants described how climate-related triggers like heat waves can agitate mental health stressors. One key informant shared, “Acute psychiatric care has grown enormously. There are ties between mental health issues and climate change that need to be addressed. There can be 5-7 day waits for a bed for those who acute psychiatric needs, and we are seeing more of these that are aggravated by climate change pathways.” Key informants described the need to mitigate the impacts of climate change by thinking creatively about urban planning and development. Specific strategies mentioned include: reducing asphalt, increasing tree coverage, and ensuring roofs are painted white instead of black. Further, key informants explained that it will be imperative for the city to work with real estate development companies that are committed to long-term strategies to address environmental concern as development increases.

The Climate Ready Boston report discusses projections of climate change’s implications on Boston neighborhoods, with particular attention to the effect of extreme temperatures, rising sea levels, extreme precipitation, and storm flooding. Eight areas of Boston that are identified as some of the most vulnerable, particularly for coastal and river flooding, include Charlestown, Charles River, Dorchester, Downtown, East Boston, Roxbury, South Boston and the South End.⁷⁷

As reported in the Climate Ready Boston Report, Boston’s land area exposed to stormwater flooding is projected to increase steadily. By the 2050s, it is projected that 7% of Boston’s land area could be exposed to frequent stormwater flooding from 10-year, 24-hour rain events (Table 30). West Roxbury, Allston, Brighton, East Boston, and South Dorchester have the largest areas of land expected to be affected by stormwater flooding, while the South End and South Boston can expect to see the greatest increase in land area exposed to stormwater flooding as sea levels rise and precipitation events become more extreme.

Table 30. Percent Land Area Acres Predicted to be Exposed to Stormwater Flooding For the 10-Year 24-Hour Event, by Boston and Neighborhood

	Total Area Acres	2030s-2050s	2050s-2100s	2070s or later

DATA SOURCE: City of Boston, Climate Ready Boston Final Report, 2016

NOTE: A 10-Year 24-Hour Storm is a common measure of major rain and snow events that refers to the amount of precipitation that has at most a one in ten annual chance of falling during a 24-hour period; Data are based on current available land. Any change to the landscape from present conditions, such as subsidence or land loss as a result of sea level rise, are not taken into consideration.

Key informant interviewees specifically identified the need for a centralized data repository to collect real-time data related to environmental health issues including climate change. This would include data like emergency department utilization during high heat days. (However, it should be noted that for the past 15 years Boston has had a Syndromic Surveillance System in place—a data system for early detection of outbreaks to monitor the size, spread, and tempo of any outbreaks—with every emergency department reporting daily). Interviewees also noted that more guidance is needed around evidence-based strategies to address climate change for those disproportionately impacted, like children, seniors, and low-income communities. There were suggestions to build from the work being led by local coalitions and city initiatives like Climate Ready Boston. Specific groups that were mentioned as potential partners include: Health Care Without Harm, A Better City, Metropolitan Area Planning Council, and the Boston Research Climate Group.

Health Care Access and Utilization

Why is This Important?

Access to comprehensive, quality health care services is important for promoting and maintaining health, preventing and managing disease, and reducing the chance of premature death. Access is multi-faceted and includes components such as the ability to enter the health care system (largely by having insurance coverage), having a regular source of health care, and being able to access health care services when needed.⁷⁸ However, inequities exist and not all who need high quality health care are able to access it. Those who face barriers to access are less likely to receive medical care, more likely to delay care, and less likely to use prevention services, resulting in poorer health status and outcomes. From a community perspective, lack of

access results in increased incidence of preventable disease, excessive and inappropriate use of hospital emergency rooms, and higher overall health care costs.

Key Findings in This Section

Boston is a city with many health care resources and a high proportion of residents have health insurance. Focus group participants, interviewees, and Boston CHNA survey respondents all indicated satisfaction with the health care in their community. Residents most commonly obtain health care from a private doctor's office or a public health clinic or community health center and BRFSS results indicated that approximately eight in ten respondents have at least one person as their personal doctor. Community survey respondents indicated that having a regular source of care is one of the top factors that makes it easier for them to get the health care services they need. Dental care was also asked about in the community health survey and nearly three-quarters of respondents reported that they had had a dental check-up in the past year. There are some differences by population group however: Asian and Latino residents were significantly less likely than White residents to indicate having one person as a personal doctor or health care provider; Latino and Black residents were less likely than White or Asian residents to have seen a dentist in the past year. Barriers to accessing health care in Boston exist according to focus group members, interviewees, and community survey respondents. The most common barriers mentioned by interviewees and focus group members included underinsurance; language and immigration status; navigation and care coordination challenges; transportation; and lack of culturally-sensitive approaches to care. For CHNA community survey respondents, long wait times for appointments and lack of evening or weekend services were the top two factors that made it difficult for them to access health care. Cost of care, especially dental care, was also cited as a challenge for some Boston residents. A higher proportion of Black and Latino residents reported cost as a barrier to accessing both medical and dental care.

Satisfaction and Use of Health Care Services

As noted previously, Boston CHNA survey respondents identified access to health care as an important factor in defining a healthy community and as a strength in their community. Mirroring these sentiments, most Boston CHNA survey respondents indicated that they were satisfied with the health care in their community. As shown in Figure 169, 71.2% said they strongly or somewhat agreed with the statement, "I am satisfied with the health care system in my community", while 86.7% agreed that they are "satisfied with my health care provider" and 87.3% agreed that they could "access health care services easily."

Figure 169. Percent Boston CHNA Survey Respondents Reporting Perceptions of Health Care System and Access, 2019

DATA SOURCE: Boston CHNA Community Survey, 2019

NOTE: Percentage calculations do not include respondents who responded “not applicable/don't know”

Similarly, focus group and interview participants spoke positively about local health services in Boston, citing close proximity to leading health care institutions. In the Community Assets section of this report, data show that there are numerous hospitals and health care centers in the city. When asked about where they go if they are sick or need advice about health, of the 2,009 Boston CHNA survey respondents answering this question, 50.9% indicated that they went to a doctor's office, while 32.1% saw their public health clinic or community health center as their place of care (Figure 170). However, nearly one in seven (12.7%) indicated that they viewed the hospital emergency room as their place for seeking care or advice.

Table 31 presents the responses to this question by respondent primary language (Chinese, English, Haitian Creole, Portuguese, Spanish, and Vietnamese), although numbers are small in some language groups, so results should be interpreted with caution. Of those sampled, most respondents indicated that a doctor's office was where they sought care, although nearly half of the 56 Haitian Creole-speaking respondents answering this question reported going to a community health center as their usual place of care (Table 31).

Continuity of primary care has been shown to be associated with fewer emergency room visits and hospitalizations.⁷⁹ The bi-annual Boston Behavioral Risk Factor Surveillance Survey asks residents about whether they have at least one person they view as their personal doctor or health care provider. Results have remained steady over the past several years, with approximately eight in ten respondents reporting having at least one person as their personal doctor. Figure 171 shows the data by sub-population and reveals differences compared to the referent groups within that sub-population. For example, Asian and Latino residents were

significantly less likely than White residents to indicate having one person as that personal doctor or health care provider. Differences were also seen by sex, age, housing status, income, education, and length of time in the United States. Data by neighborhood can be found in [APPENDIX I](#).

Figure 171. Percent Adults Reporting Having a Personal Doctor or Health Care Provider, by Boston and Selected Indicators, 2013, 2015, and 2017 Combined

DATA ANALYSIS: Boston Public Health Commission, Research and Evaluation Office

NOTES: Bars with pattern indicate reference group for its category; Asterisk (*) denotes where estimate was significantly different compared to reference group within specific category ($p < 0.05$); Error bars show 95% confidence interval

A similar question was asked on the Boston CHNA survey. It should be noted that this survey used a convenience sample rather than a probability sample, so results may not necessarily be generalizable as the BBRFSS survey. While 66.1% of the Boston CHNA survey sample indicated that they had at least one person that they thought of as their personal doctor or health care provider, 56.8% Vietnamese-speaking respondents reported this (See [APPENDIX I](#)).

While dental care did not come up often in the interviews and focus groups, survey respondents were asked about the last time they had a dental check-up. Of the 1,806 respondents who

answered this question, nearly three-quarters (72.3%) indicated that they had a dental check-up in the past year (Figure 172). However, as shown in Figure 172 responses differed significantly by race/ethnicity, age, and educational attainment. Figure 173 presents responses by primary language, where 64.4% of Spanish-speakers reported having had a dental check-up in the past year.

Figure 172. Percent Boston CHNA Survey Respondents Reporting Having Had a Dental Check-up Within the Past Year, by All Respondents and Selected Indicators, 2019

NOTE: Percentage calculations do not include respondents who responded “prefer not to answer/don’t know;” Asterisk (*) denotes where estimate was significantly different compared to the rest of the survey sample

Results from the Youth Risk Behavior Survey completed by BPS high school students indicate that while nearly eight in ten (78.2%) Boston public high school students have reported seeing

a dentist in the past year, this significantly differs by female and male students, and race/ethnicity within female and male students (Figure 174). Additionally, LGBTQ students were significantly less likely to report seeing a dentist in the past year than heterosexual or non-transgender students.

Figure 174. Percent Boston Public High School Youth Reporting Seeing a Dentist in the Past Year by Selected Indicators, 2015 and 2017 Combined

NOTE: Bars with pattern indicate reference group for its specific category; Asterisk (*) denotes where estimate was significantly different compared to reference group within specific category ($p < 0.05$); Error bars show 95% confidence interval

Health Insurance

Very few Boston residents are uninsured. According to American Community Survey 2013-2017 estimates, 3.9% of the overall population (civilian, noninstitutionalized) in Boston were uninsured, while only 1.4% of the population under 19 years old were uninsured.⁸⁰ Among the Boston civilian population, 29.6% have Medicaid (MassHealth) coverage.⁸¹

These statistics mirror how insurance was discussed in the focus groups and interviews. Very few focus group participants spoke about concerns of being uninsured. Those that did discuss challenges with lack of insurance were homeless, undocumented immigrants, or students. Homeless residents in focus groups specifically discussed the challenge of not having a

permanent mailing address or being unable to access birth certificates as making it difficult to gain insurance coverage.

A more common theme that emerged in focus group discussions was that many residents reported being under-insured—or having insurance coverage that does not adequately cover someone’s full health care needs. Many focus group participants, especially those on MassHealth, perceived that there was a limited number of providers, particularly specialists, who accepted MassHealth. Focus group participants who were Dorchester residents, for example, described needing specialty treatments for chronic or debilitating conditions but being denied coverage after a limited time. One focus group participant shared, *“The only thing that helps me with my condition is heated pool therapy, but MassHealth only covers it for 8 sessions. Why 8 weeks if my condition is lifelong?”* Others discussed challenges with dealing with the complexities of insurance coverage and figuring out what was even covered and what was not. As one focus group participant commented, *“It should never be this difficult to get insurance sorted out. If I miss one injection [of insulin], I could put my life in danger.”*

Focus group participants who identified as low income, homeless, or as residents in recovery most frequently cited a need for better dental coverage, citing limited coverage with public insurance. One participant from Dorchester shared, *“I have so many holes in my mouth because MassHealth doesn’t cover any filling or root canals. If you need anything other than a cleaning, it’s not going to be covered. It’s the bare minimum.”*

Barriers to Health Care Access

While focus group, interview, and survey participants were positive about the quality and proximity of health care in their community, they still cited several concerns over access. The biggest barriers to health care access discussed in the focus groups were: being under-insured; language and immigration status; navigation and care coordination challenges; transportation; and lack of culturally-sensitive approaches to care. Cost was not identified as a major barrier to care for the majority of participants; however, a few focus group participants discussed cost barriers in relation to affording medication for chronic diseases, and the challenge of competing costs on a fixed income.

“When you’re stressed about the fact that not enough money is coming in, you have bills to pay, and then a medical issue that needs to be addressed, but you can’t afford the treatment...you make hard decisions.” — Focus group participant

Engagement with Health Care Providers and Staff

Unfriendly, uninterested, or rushed health care providers and office staff in health care settings were also issues that focus group participants mentioned. Some focus group participants described feeling “unseen” by their health care providers, citing feeling rushed or seeing providers who seemed disengaged. One East Boston resident shared, *“I went to the doctor, and no one looked me in the eyes; they sent me home with so many medicines, but no one asked me how I was...it’s like they don’t see the whole person.”*

Navigating a Complex System

When discussing access to care, a prominent theme across focus groups and interviews was the challenge of navigating the complex health system. Focus group members spoke about the struggle understanding their health care benefits, reporting that they “*felt lost in the system.*” Seniors were described as especially vulnerable to challenges navigating the health system. Several focus group participants emphasized that many simply do not know what resources are available to them or how to access them. One interviewee summarized, “*When you have to find services and then you have to go to them...when you’ve [experienced] trauma, coordinating all this stuff yourself is really hard; organizing and having to stay on top of it. We are not as good with coordination as a system; we’ve talked about it, but we don’t really know what that looks like yet at the ground level.*” Senior focus group participants also indicated that more efforts were needed to educate seniors on insurance coverage. One resident from Mattapan shared, “Medicare patients are expected to learn and understand how everything works, what they have and don’t have on their own.”

Participants identified a need for more navigation services that could help patients access services and resources across sectors. Multiple key informants and focus group participants identified peer navigators and community health workers as valuable resources. One focus group participant shared, “*Doctors only have a certain amount of time and you can’t rely on them to talk to patients about everything. But there does need to be more navigators available to help patients understand and explain.*” Key informants echoed the value of these services; however, reimbursement models and funding constraints appear to make it difficult for organizations to fund these positions, as some key informants noted.

Transportation Barriers

Transportation was also mentioned by assessment participants as a challenge to accessing health care. Some focus group participants noted that public transportation is limited for accessing services locally as well as for accessing specialty care. One parent shared, “*My son has to see a specialist, but I don’t drive, and it can take up to 3 hours to get to the specialty care [he goes to outside the city].*” Another key informant echoed this sentiment, sharing, “*We need more resources within the community so [residents] don’t have to travel through a bunch of different neighborhoods. Even getting to BMC from Mattapan or Dorchester is a trek for a lot of people; are you really going to counseling when you have to take two busses and a train to get there?*”

Culturally-Sensitive Approaches to Care

For immigrant communities, participants described immigration status (e.g., undocumented vs. documented status) as a significant barrier to accessing health care. Key informants spoke of fear in undocumented or mixed status families which prevented residents from seeking care. One key informant explained, “*Immigrant populations face challenges [accessing care]. It is a hostile environment; even though we are a sanctuary city they do not feel safe.*” Another key informant perceived that immigration fears were particularly prominent in the Latino community, one sharing, “*Hispanic folks are more worried that they will get picked up [by authorities]; there is a lot of real concern out there. Residents are going underground and there’s a hesitation working on anything including treatment, health care, and housing.*” Further, the need for increased linguistic capacity in the health care and social service landscape was also a

common theme among qualitative conversations, particularly in non-English focus group and key informants who worked in health and social services.

The importance of culturally-sensitive approaches to care were also discussed among multiple focus group and interviews. For example, some focus group participants spoke of cultural and gender norms of not seeking health care unless things are bad. One Mattapan resident expressed, *“Haitian men only take care of themselves when they are very sick. They [don’t seek out] health care; women are likely to seek health care because they are having children and take care of their families.”* Others spoke of preferences for non-Western approaches to care, with one interviewee sharing, *“Clients may have more stigmatized view of Western Medicine... may rely more heavily on natural healers that are more connected in the neighborhood.”* These culturally-sensitive approaches to care were also described as imperative for religious minority groups, shared key informants. For example, one interviewee explained that there are misconceptions in the health field related to the Muslim community such as preferences for same-sex providers. They shared, *“Even in Boston, which is a very open, forward-moving city...we’re viewed as being repressed because we don’t shake hands or want male providers; but in my mind, it’s about the choice of separation between men and women.”*

Further, LGBTQ youth described the need for more LGBTQ-centric care but also stressed the importance of providers taking into considerations the many intersecting identifies that a patient could hold. For example, being a queer-identifying teenager who is also a person of color. As one young person described, *“We have to face a double whammy with already having the stigma of being LGBTQ and then adding race on top of that makes it even harder.”*

CHNA Survey Respondent Barriers: Inconvenient Hours/Location, Cost, Transportation, and Provider Availability

Some of these themes were identified in the Boston CHNA survey, while survey respondents were also likely to cite wait times and availability of hours as issues to accessing care. When Boston CHNA survey respondents were asked about the factors that made it harder for them to get the health care services they needed in the past two years, issues related to convenience (long wait for an appointment (43.6%), lack of evening/weekend services (38.0%)), cost of care (33.7%), lack of transportation (18.9%), and office not accepting new patients (18.2%)) were cited as the top five most challenging issues (Figure 175); however none of these were cited by a majority of respondents. As shown in Table 32, many of these issues were similar across sub-populations by primary language, although instead of lack of transportation or office not accepting new patients being an issue, Chinese-speaking respondents indicated *“language problems/could not communicate with health provider or office staff”* and *“unfriendly doctors, providers, or office staff”* and Vietnamese-speaking respondents indicated *“afraid to ask questions or talk to doctors/medical people”* as challenges. Spanish- and Portuguese-speakers also indicated that *“don’t have health insurance that covers what I need”* as a barrier to getting health care services in the last two years, while Haitian Creole-speaking respondents additionally cited *“don’t know what types of services are available”* as a barrier.

Table 33 shows responses by additional sub-populations, including by race/ethnicity, parents who have children under 18 years old, LGBTQ respondents, and respondents under 18 and 65+ years old.

Cost and Affordability of Care

While cost was not cited as the most critical barrier to health care access among focus group, interview, and survey respondents, specific questions on both the BRFSS and the Boston CHNA survey asked respondents if there was a time in the past 12 months when they needed to see a doctor or a dentist but could not because of the cost. Overall, cost is a much bigger barrier for dental care than it is for overall health care. Figure 176 shows that in the combined BRFSS data for 2013, 2015, and 2017, 10% of respondents did not see a doctor in the past 12 months due to cost, and responses differed significantly within some specific sub-populations by race/ethnicity, housing status, education, age, foreign or U.S. born, income, and employment. The dental question was only asked on the 2017 BRFSS, and results show that 17.4% of residents could not see a dentist in the past 12 months due to cost. Figure 177 shows results by different sub-populations.

Figure 176. Percent Adults Reporting Could Not Afford to See a Doctor in Past 12 Months, by Boston and Selected Indicators, 2013, 2015, and 2017 Combined

DATA ANALYSIS: Boston Public Health Commission, Research and Evaluation Office

NOTES: Bars with pattern indicate reference group for its specific category; Asterisk (*) denotes where estimate was significantly different compared to reference group within specific category ($p < 0.05$); Error bars show 95% confidence interval

A similar question was asked on the 2019 Boston CHNA survey, and overall responses were slightly higher, with 12.5% of the sample indicating that they could not see a doctor in the past 12 months due to cost and 22.9% reporting this for a dentist. Figure 178 and Figure 179 present the survey responses to these questions by primary language spoken, although results should be interpreted with caution given the small sample sizes in some language groups.

Facilitators to Health Care Access

While much of the discussions in the focus groups and interviews emphasized the challenges in accessing health care, having insurance and proximity to health care services were cited as factors that supported people’s access to care. When Boston CHNA survey respondents were asked what factors made it easier for them to get the health care services they needed in the past two years, having a regular source of care (63.3%), having insurance cover what they needed (49.7%), providers taking their insurance (47.8%), having positive interactions with doctors, providers, or office staff (39.8%), and feeling comfortable asking questions (37.3%) were the top five factors cited (Figure 180).

Table 34 and Table 35 present the top five factors that different sub-populations noted made it easier for them to get the health care services they needed in the past two years. Table 34 shows these results by primary language spoken, and Table 35 presents results among different

racial/ethnic groups, parents of children under 18, LGBTQ respondents, and respondents who are under 18 and 65+ years old. While having a regular source of care and insurance covering what they needed was important for everyone, particular facilitators for some groups included: having positive interactions with doctors, providers, or office staff among Portuguese speakers, Vietnamese speakers, Black respondents, Asian respondents, parents, LGBTQ respondents, and those under 18 years old and 65+ years old; affordable care among Chinese-speaking and Haitian Creole-speaking respondents; and having providers or staff speak their language/understand their culture among Chinese speakers, Vietnamese speakers, Asian respondents overall, and youth survey respondents under 18 years old. Availability of public transportation was also helpful for many survey respondents.

Figure 180. Percent Boston CHNA Survey Respondents Reporting Factors That Made It Easier for Them to Get Health Care Services They Needed in Past Two Years (N=1,509), 2019

COMMUNITY RESIDENTS' AND LEADERS' VISION AND SUGGESTED OPPORTUNITIES

Participants in interview and focus group discussions were asked for their suggestions for addressing identified needs and their vision for the future. This section summarizes and presents these recommendations for future initiatives.

- **Employment and Workforce-** Focus group participants commonly discussed challenges securing well-paying jobs due barriers that include educational requirements, hiring processes, technology skills, and having a criminal record. Community suggestions to address employment barriers include addressing minimum education requirements to be more inclusive of those with valuable lived experience; subsidizing the cost of childcare so low-income parents can work towards upward mobility through education and job training; and increasing meaningful employment opportunities for young people, especially during the summer and school breaks. Participants shared that it would be imperative that these efforts focus on “21st century skills” like technology, professional communication, information literacy, and critical thinking. Increasing access to trade professions like machine training, carpentry, and electrical work were also described as valuable.
- **Income and Financial Security-** These were often discussed in the context of access to employment and income inequality. Participants talked about the challenges making ends meet due to low-wage jobs with little room for advancement. Specific suggestions include investments that enhance access to careers for Boston youth that lead to stable employment and economic mobility, and pathways for immigrant communities and non-English speakers to professional advancement in order to engage a workforce that meets the needs of a diverse population.
- **Education-** Children with special needs, undocumented students, and those who have experienced trauma were identified as groups that needed more support in and outside of the classroom. Suggestions were made to focus resources on early childhood education, especially for children ages 0-5; increase social supports in public schools, particularly in communities of color; train educators on trauma-informed approaches to recognize trauma symptoms and respond accordingly; use restorative justice approaches to discipline and behavior issues; and address chronic absenteeism by bolstering wrap around services like in-home therapy, community field coordinators, and therapeutic mentors.
- **Food Insecurity-** Key informant interviews and low-income focus group participants across neighborhoods discussed the challenge of not having enough money to afford the food they and their families needed. Participants identified seniors and children as being especially vulnerable to being food insecure. Suggestions were made to increase opportunities to access healthy and affordable food through: urban farming and community gardens; farmer’s markets that accept SNAP benefits; and strengthening initiatives that address food access from a clinical perspective, where practitioners can prescribe services and are reimbursed as part of the ACO plans.

- **Housing-** Focus group and interview participants stressed the importance of mitigating the negative impacts of gentrification and displacement by creating more opportunities for home ownership in non-White communities to build generational wealth; and pushing for long-term renewable leases for nonprofits and social services agencies that are being strained by rising costs to operate. Other specific suggestions include: exploring small property acquisitions to develop community affordable housing; supporting nonprofit developers; investing in more senior housing and supports; and increasing linkage fee programs—an alternative to traditional inclusionary housing programs that attempt to link the production of market-rate real estate to the production of affordable housing. Key informant interviewees also noted ACO implementation as an opportunity to strengthen and coordinate the housing and health care sectors. Leveraging hospital community benefit funding with Medicaid flex service dollars may provide an opportunity for greater investment in housing instability. Additionally, moving these health care-housing partnerships to providing place-based/housing-based services for health care and social services would reach people where they live with the range of medical and ancillary services that they need in a coordinated way.
- **Transportation-** Some focus group participants reported being generally satisfied with transportation access in their neighborhoods, while others voiced concerns about cost, timeliness, and accessibility—especially for the elderly. Specific suggestions include focusing on transportation equity in lower income communities that tend to have longer commuting times; be engaged in reducing traffic by investing in speedy bus lanes; continue making the city more bikeable; and exploring fee structures for ride share programs to generate revenue for operational costs at the local level.
- **Chronic Disease-** Interview participants indicated that there is a need to focus on prevention strategies and chronic disease management—particularly to prevent diabetes and obesity. Community residents indicated the need for more affordable gym and healthy food options, especially in the winter time and especially for young people during school breaks. Community residents suggested investing in exercise stations in public parks and within community health centers. There were also suggestions to invest in community outreach efforts to increase public knowledge about prevention of chronic diseases in trusted community spaces like faith-based organizations and in public schools.
- **Mental Health-** Stress, anxiety, and depression were the most frequently-cited challenges among Boston residents. Community suggestions to address mental health issues include investing in more mental health supports in public schools—especially for young children who have experienced trauma and for underserved communities like non-English speakers, LGBTQ residents, and homebound seniors. Also stressed was the importance of reducing cultural stigma around mental health services and recruiting more clinicians who reflect the rich racial and ethnic diversity of Boston.
- ▶ According to community participants, it will be imperative to consider intersecting identities and social statuses that may be salient to mental health approaches, for example, those who identify as queer people of color or immigrant parents of children with special needs. In terms of careers in the field of mental health and substance use, participants stressed that it will be important to address systemic barriers that detract professionals from seeking careers in the field due low salaries, emotionally demanding work, and stringent certification requirements. Suggestions include: investing in micro degrees that allow residents to advance professionally in a less costly way; invest in

student loan forgiveness initiatives; forging stronger connections between learning institutions and the job market; and addressing fee for service models and reporting requirements that limit service-delivery and creativity.

- **Substance Use-** Assessment participants mentioned a variety of substances including opioids, marijuana, and prescription drug use as issues in their communities. Participants were especially concerned about the impact of substance use disorders on young people and suggested focusing on prevention efforts, especially related to marijuana use and prescription drug use among adolescents.
- **Violence and Trauma-** Community violence was reported as a frequent concern by focus group participants, with children and communities of color being disproportionately affected. Intimate partner violence was also mentioned by participants who identified non-English speaking immigrants as particularly vulnerable. Suggestions to address violence and trauma in the city include: restoring trust among government, police, and health care institutions by strengthening community linkages and improving community cohesion. Specific examples include intergenerational programs and services that are specific to diverse affinity groups; a multi-faceted approach to community safety that includes community-based policing, strengthening partnerships with community-based organizations and law enforcement, and transparency through venues like community share-outs. Hosting these events in familiar spaces like faith-based organizations, libraries, and community centers will be important. In terms of trauma, suggestions were made to: invest in trauma-informed approaches beginning in early childhood and continuing throughout high school; build on the work of local groups to avoid duplicative services; widen the trauma-informed care lens by expanding neighborhood trauma teams and bringing interdisciplinary groups together; and focusing on familial responses to trauma from a community-driven, grassroots approach. Also stressed was the importance of compensating community members for their participation and expertise in these efforts via a stipend.
- **Maternal and Child Health-** A common theme that emerged among focus group with parents—many of whom identified as single mothers—was the need for more supports to learn positive parenting skills. Unaffordable and inconvenient childcare was also mentioned as a significant concern among focus group participants; suggestions were made to subsidize the cost of childcare for low-income families, especially for single-headed households. Additionally, a few key informants noted the lack of data on child health in the city, which made it difficult to enumerate a problem or track change. They saw the Boston Census survey supplement on child care and other new data initiatives starting to fill this gap, but would look forward to more robust and collaborative efforts on data gathering around child health.
- **Environmental Health-** Environmental health concerns such as climate change and air pollutants were discussed among assessment participants. There were suggestions to address environmental health concerns in a systemic way and in partnership across sectors and disciplines, especially as new developments increase across the city. According to key informants, it will be important to target neighborhoods that have been deemed as high-risk by initiatives such as Climate Ready Boston. There were also suggestions to invest in a centralized data repository to track environmental health data in order to more accurately measure extreme heat days, flooding, and natural disasters; these data will facilitate more meaningful discussions related to climate change's impact on health care costs.

- **Health Care Access-** The biggest barriers to health care access discussed in the focus groups were: being under-insured; language and immigration status; navigation and care coordination challenges; transportation; and lack of culturally-sensitive approaches to care. Suggestions related to health care access was to increase supports for navigating the complex health system and delivering culturally-sensitive care and linguistically appropriate services to diverse groups. Community residents shared that it will be essential to train staff from diverse communities for professional roles such as peer navigators and interpreters. Other areas to focus on according to assessment participants include bolstering oral health services for those on public insurance, addressing re-imburement barriers for sustaining positions like peer navigators and community health workers; and mitigating transportation barriers by exploring alternatives such as ride share stipends for patients.
- ▶ Collaboration between different organizations and agencies were identified as a strength and has improved in recent years; however, **respondents identified a need for even greater collaboration and information/data sharing to better serve their patients and clients, especially related to the roll out of Accountable Care Organizations.** Specific suggestions include incentivizing collaboration between health care and community-based organizations in an equitable way and using data to that translates into a real implementation action plan that is owned by a convener who will drive the plan forward and hold institutions accountable.
- ▶ From a key informant perspective, funding was top of mind for sustaining efforts across the public and health care sector to stabilize and enhance programming. Specific suggestions including **pursuing multi-year funding that allow organizations to respond to crisis and opportunities, and to build internal and external capacity.** Other suggestions include diversifying funding streams to focus on private and philanthropic endeavors as federal and state funding becomes more limited. For example, there were suggestions to model Rhode Island's health equity zones that focus on place-based investments in the built environment for the most at-risk neighborhoods.

KEY THEMES AND CONCLUSIONS

The Boston CHNA-CHIP Collaborative used a participatory, collaborative approach to conduct the first joint citywide CHNA through a review of existing data, community survey, and discussions with community residents and key informants. This assessment report provides a comprehensive overview of the health-related needs, strengths, and resources of Boston – including specific population groups – within a socioeconomic context to inform future planning. Overarching themes that emerged from this synthesis that cut across multiple topic areas include the following:

- **Health disparities across most issues show similar patterns by racial/ethnic group and socioeconomic status, and mirror the historical inequities brought about by generations of institutional racism, structural barriers, and discriminatory policies.** Whether differences in cancer mortality or asthma prevalence – or unemployment rates and housing instability – similar patterns can be seen in the data, with communities of color, immigrant communities, lower income individuals, and residents of low resourced neighborhoods, among others, experiencing a disproportionate burden across nearly all areas. Although current data sources are not currently designed to be able to examine intersecting identities more deeply, this disproportionate burden is likely even worse when considering intersectionality—that is, the complex, cumulative way in which the effects of multiple forms of discrimination (such as racism, sexism, and classism) combine, overlap, or intersect, especially in the experiences of marginalized groups. These issues are dynamically intertwined and reflect the cumulative and current challenges residents face resulting from historical and structural inequities across multiple systems.
- **With a current population of nearly 670,000 residents, Boston has experienced—and is expected to continue to experience—population growth across every neighborhood in the city, though growth rates across neighborhoods vary.** Overall, Boston is a young city, with about one-third of residents under the age of 24, that continues to experience population growth. The greatest increases in population have occurred in Roxbury, South Boston, Hyde Park, East Boston, and Charlestown.
- **Boston is a richly diverse city in terms of racial, ethnic, and linguistic population groups, though data show this diversity is not similar across neighborhoods.** Boston's large immigrant and non-English speaking communities were identified as facing unique challenges related to social and economic factors as well as navigating the health care system. The wide-ranging diversity of Boston residents presents challenges when delivering health and social services that aim to meet the multitude of needs across the city. Additionally, CHNA community survey results and conversations in focus groups indicated that subtle and overt discrimination is an issue in Boston, particularly for immigrants and non-English speakers, LGBTQ residents, youth and older residents, substance users and the homeless.
- **Although unemployment rates are low and there is economic opportunity for many residents across the city, there are substantial differences in financial security across neighborhoods and racial and ethnic groups.** The median household income in Boston is \$62,021 but ranges from \$27,964 in Dorchester to \$170,152 in South Boston. In four communities—Dorchester, Fenway, Roxbury and the South End— approximately 25-37% of residents live below the federal poverty level. Focus group and interview participants

discussed the role poverty plays in exacerbating health challenges, particularly among vulnerable groups. Quantitative data show that risk-related behaviors and health outcomes generally continue to have inverse relationships with socioeconomic factors.

- **Housing affordability and its implications emerged as a key theme that arose across secondary data, the community survey, and focus groups and interviews.** Of all social determinants identified as imperative to health and well-being, housing stability emerged as a top priority among participants. More than half of those in renter-occupied units across the city are housing cost-burdened, meaning they spend more than 30% of their income on housing. Residents frequently discussed issues of gentrification, long wait lists for Section 8 housing, housing discrimination, overcrowding, and poor housing quality as consequences of a tight and expensive housing market.
- **The impact of chronic diseases and their risk factors—especially diabetes, obesity, and pediatric asthma—emerged as a priority concern among residents.** Residents of color, as well as residents who live in Roxbury and Dorchester are disproportionately affected by chronic diseases. Assessment participants frequently discussed a number of social determinants that presented challenges to the prevention and management of these chronic conditions. In addition to poverty and high housing costs that force individuals to prioritize their spending, a lack of affordable recreational programming and access to nutritious food were described as barriers to health and well-being. Lower income neighborhoods were described as having fewer affordable gyms, grocery stores, and fast food and convenience stores compared to affluent areas.
- **Behavioral health, specifically mental health and drug addiction among young people are growing concerns among community residents; opioids, prescription medication, and marijuana use were reported as most concerning.** Co-occurring mental health and substance use issues were frequently discussed among key informants, as well as the interrelationship between trauma, mental health, and substance use. Quantitative data show that one in five Boston residents report persistent anxiety and this proportion has increased over time. The rate of opioid overdose deaths in Boston has also significantly increased, particularly among Latino residents. Specific population groups are disparately affected by mental health and substance use, especially residents who are younger, LGBTQ, lower income, and of communities of color.
- **Violence-based trauma was identified as a major factor of negative community health outcomes, and there is a need for more trauma-informed approaches to care, particularly for children and communities of color.** One in four Boston CHNA community survey respondents described their neighborhoods as unsafe or extremely unsafe, with Black and Latino respondents more likely to describe their communities this way. Apart from community violence and intimate partner violence, assessment participants identified poverty, and more recently, the fear of deportation and family separation, as a growing issue. Exposure of children and youth to unhealthy relationships and violence (adverse childhood experiences) is also of concern: nearly one in five Boston adults reported experiencing one adverse experience over their lifetime.
- **Environmental health risk factors are a particular concern in relation to air quality, effects of climate change, and the built environment.** Poor environmental health quality has the greatest impact on low-income communities. Issues such as noise and air pollution and dangerous traffic were prominent concerns among survey respondents. Indoor air quality is also an issue, and more than one in ten Boston adults on the BRFSS reported exposure to secondhand smoke, with Asian, Black, and Latino residents all significantly

more likely than White residents to report exposure. The effects of climate change were also noted, with flooding being one of the most significant issues. Boston emergency department utilization rates and costs for climate-driven health issues are expected to rise in the future. Climate change projections estimate that 7% of Boston's land area could be exposed to frequent stormwater flooding by 2050.

- **Boston has many health care and social service assets that can be leveraged, but access to those services is a challenge for some residents.** Proximity of health care services and education institutions, diversity and multiculturalism, and engaged residents were noted as key strengths among Bostonians that can be leveraged in future planning. Barriers to care were multifaceted and included underinsurance, language and immigration status, navigation and care coordination challenges, transportation, and lack of culturally-sensitive approaches to care.
- **Strengthening partnerships and infrastructure for collaborative data gathering and sharing can facilitate greater coordination and identify specific population groups most in need.** Undertaking this collaborative CHNA demonstrated that organizations can leverage their strengths and resources for collaborative assessment and planning. However, as extensive as the data gathering was for this effort, it also identified current limitations. Large datasets are not necessarily available on some population groups such as residents who speak specific languages or on particular topics such as child health ages 0-14 years old. Additionally, data sharing across organizations and agencies is challenging. As the Collaborative engages in further planning, there is opportunity ahead to strengthen the relationships, practices, and infrastructure to address these data limitations. In the future, potentially more granular analyses by neighborhood, topic, or population group can be conducted to help tailor strategies for action.

PRIORITIES FOR COLLABORATIVE ACTION

The Boston CHNA-CHIP Collaborative aims to undertake a collaborative planning process May - September 2019 to identify the prioritized issues on which this cross-sector group will take action. The planning process includes identifying priorities, goals, measurable objectives, strategies, and success metrics for a three-year community health improvement plan (CHIP).

The first step in the planning process is to identify the priorities for the CHIP. Prioritization allows institutions and organizations to target and align resources, leverage efforts, and focus on achievable strategies and goals for addressing priority needs. Through a systematic, engaged approach that is informed by data, priorities are identified for the Collaborative to focus its planning efforts. This section describes the process and outcomes of the Boston CHNA-CHIP Collaborative prioritization process.

Process and Criteria for Prioritization

In April 2019, the CHIP work group—comprised of representatives from hospitals, health centers, community organizations, and the Boston Public Health Commission—developed prioritization criteria and an engagement strategy for identifying 2-4 priority needs for the subsequent Community Health Improvement Plan. Criteria were selected to assess the magnitude of community issues and their impact on the most disadvantaged population groups. The criteria and guiding questions selected are below; full definitions of each of these criteria can be found in Appendix J.

- **Burden:** How much does this issue affect health in Boston?
- **Equity:** Will addressing this issue substantially benefit those most in need?
- **Impact:** Can working on this issue achieve both short-term and long-term change?
- **Feasibility:** Is it possible to address this issue given infrastructure, capacity, and political will?
- **Collaboration:** Are there existing groups across sectors willing to work together on this issue?

Prioritization Process

The prioritization process was multi-stepped and aimed to be inclusive, participatory, and data-driven. During May 2019, several steps were taken to identify the final 2-4 priorities for the planning process.

Early-Mid May 2019

First, a 16-page draft Executive Summary of this CHNA report was sent to over 150 organizations and individuals along with an online survey for prioritization. The online survey included 19 key issues that emerged from the draft CHNA and participants were asked to rate each issue against each of the five criteria (burden, equity, impact, feasibility, and collaboration) from 1-4 with 1=low, 2=medium, 3=high, and 4=very high. Figure 181 indicates the average score across the five criteria for the issues rated.

Figure 181. Rating Tool Average Score of 1=Low, 2=Medium, 3=High, 4=Very High across Five Criteria (Burden, Equity, Impact, Feasibility, and Collaboration), (N=38 organizations), 2019

Concurrently in early to mid-May, numerous small group discussions occurred throughout the city with community residents, organizational staff, and other stakeholders. These discussions included a data presentation of the draft CHNA key findings, overview of the 19 key issues that emerged and the five criteria used for prioritization, and an interactive discussion with participants on what priorities rose to the top for them based on these criteria. Ten meetings were held with 121 individuals. Participants included community residents from Roxbury, Mattapan, and Jamaica Plain (three community meetings), members of the Boston Board of Health, nine City of Boston departments, leadership from community health centers across Boston, and members of health care institutions' community advisory committees/ community advisory boards. A number of priorities commonly rose to the top in these qualitative discussions:

- **Housing** – specific concerns related to affordability, displacement, gentrification, homelessness
- **Employment & income** – specific concerns related to job opportunities and economic security; important to focus on upstream inequities
- **Mental health** – critical to note that many mental health issues co-occurring with substance use; concerns around availability of services and barriers to accessing services
- **Substance use** – critical to note that many substance use disorders are co-occurring with mental health issues; specific concerns around opioids, alcohol, and youth smoking
- **Violence & trauma** – specific concerns related to community safety and the impact of trauma on mental health

- **Chronic conditions** – specific concerns related to obesity, healthy food access, cancer, and diabetes
- **Food insecurity** –specific concerns around economic insecurity and the connections to obesity

The results from the online prioritization rating survey and small group discussions were used to refine the priority list from 19 topics to the following 9 potential priorities:

- Housing – Affordability, Quality, and Homelessness
- Food Insecurity/Hunger
- Employment & Income/Financial Insecurity
- Education
- Substance Use
- Mental Health
- Community Violence
- Obesity, Healthy Eating, Physical Activity
- Accessing Health care, Childcare, & Other Services

Late May 2019

The next step in the prioritization process was a large in-person meeting for further engagement and refinement in the prioritization process. On May 29, 2019, over 100 community residents and organizational staff across a multitude of sectors community residents attended a three-hour evening meeting in Roxbury. This meeting included a brief data presentation on the key findings from the draft CHNA, a description of the prioritization process thus far and the refined set of nine priorities, small group discussions, and a large group voting process. The goal of the voting process was to identify 2-4 priorities for collaborative planning.

During the voting process, each participant received four dots, to vote for four issues among the nine (one dot per issue). The results of the dot voting can be found in Table 36.

Table 36. Initial Results of May 29th Prioritization Meeting Dot Voting Process

Topic	Total Votes
Housing – Affordability, Quality, and Homelessness	66
Employment & Income/Financial Insecurity	63
Mental Health	48
Access to health care, childcare, & other services	32
Education	31
Food Insecurity/Hunger	26
Substance Use	20
Community Violence	15
Obesity, Healthy Eating, Physical Activity	10
Other	1

After the dot voting process, participants discussed the results to identify the top priorities. Participants suggested combining mental health and substance use into the more inclusive category of behavioral health and to consider integrating education into the category of

employment and income/ financial security. At the end of the discussion, participants were leaning towards the top priorities as:

- Housing
- Behavioral Health
- Employment, Income/Financial Insecurity, and Education
- Access to Health care, Childcare, and Other Services

Early June 2019

In early June 2019, the Boston CHNA-CHIP Collaborative Steering Committee met to discuss the identified priorities and to brainstorm a cross-cutting/overarching focus to frame future planning. From that discussion, the Steering Committee recommended renaming the Employment, Income, and Education priority to be *Financial Security and Mobility* to encapsulate how employment, income, education, and workforce training are all critical and inter-related factors that can contribute to financial security.

Additionally, there was a strong movement to have a cross-cutting and overarching focus for the plan to guide this collaborative work. Discussions centered on an overarching focus being racial equity to recognize that institutional racism and structural inequities are what drive the health inequities we see around race, ethnicity, and language in the city.

Prioritized Needs for Collaborative Planning

After further definition and refinement of the priorities and cross-cutting/overarching plan focus by the Steering Committee and CHIP work group in mid-June, the final prioritized needs for the planning process are:

- **Housing** (including affordability, quality, homelessness, ownership, gentrification, and displacement)
- **Financial Security and Mobility** (including jobs, employment, income, education, and workforce training)
- **Behavioral Health** (including mental health and substance use)
- **Accessing Services** (including health care, childcare and social services)

The cross-cutting and overarching focus of the planning process will be around ***Achieving Racial and Ethnic Health Equity*** recognizing that institutional racism and structural inequities are what drive the health disparities we see around race, ethnicity, and language in the city for nearly all issues.

Next Steps

From June-September 2019, the Boston CHNA-CHIP Collaborative, in conjunction with key stakeholders and community residents, will develop an implementation strategy that outlines next steps to address the prioritized health needs from the CHNA. The CHIP development process will commence with a full-day planning session in late June 2019 to develop the initial output for the goals, objectives, and strategies within each priority area. Further refinement and development of the CHIP will occur during the summer 2019, with a final CHIP report and Year 1 Action Planning to be completed by September 2019.

NEIGHBORHOOD PROFILES

The following section presents one-page summaries by neighborhood of key social, economic, and health indicators included in this report.

As noted in the beginning of this report, Boston neighborhoods can be identified in several ways. In this report, zip codes are used to identify neighborhood boundaries since this information is collected with health data analyzed by Boston Public Health Commission and is consistent with previous Health of Boston reports. Please note that the zip code neighborhood definitions used in this report may differ from what are used by other organizations and agencies.

The zip codes used in this report for identifying neighborhoods are those currently used by the United States Postal Service (USPS). USPS zip codes are not based on geography, demographics, or population size; they are collections of mail delivery routes that are defined at the convenience of the U.S. Postal Service and may change from time to time.

Data from the U.S. Census Bureau comes in the form of Zip Code Tabulation Areas (ZCTAs), generalized areal representations of USPS zip code service areas. ZCTA is a trademark of the U.S. Census Bureau whereas ZIP Code is a trademark of the U.S. Postal Service.

Neighborhood	Zip Codes/ZCTAs
Allston/Brighton	02134, 02135, 02163
Back Bay (includes Downtown, Beacon Hill, North End, West End)	02108-02110, 02113-02114, 02116, 02199
Charlestown	02129
Dorchester (zip codes 02121, 02125)	02121, 02125
Dorchester (zip codes 02122, 02124)	02122, 02124
East Boston	02128
Fenway	02115, 02215
Hyde Park	02136
Jamaica Plain	02130
Mattapan	02126
North End	02113
Roslindale	02131
Roxbury	02119, 02120
South Boston	02127, 02210
South End (includes the zip code typically used to identify Chinatown (02111))	02111, 02118
West Roxbury	02132

Allston/Brighton	Allston/ Brighton	Boston Overall	Comparison to the Rest of Boston*
Demographics			
Population count estimate (2013–2017)	63,270	669,158	--

APPENDIX C. TECHNICAL NOTES FOR COMMONLY CITED DATASETS

These technical notes were provided by Boston Public Health Commission and include background around data sources commonly used throughout this report.

Survey Data

U. S. Census Bureau, American Community Survey

The American Community Survey (ACS) uses a sample of the population to provide information about demographics, housing, and socioeconomic characteristics of communities. People who live in households, students, and those in institutions or other group quarters (e.g. jails, college dormitories, and nursing homes) are sampled. The ACS is administered through mailed and online questionnaires and can include telephone or personal visit follow-up if needed. The mailed and online questionnaires are available in English and Spanish and can be made available in Chinese, Russian, Korean, and Vietnamese. Telephone interviews are available in over 30 languages.

This report presents estimates both for single and aggregated years of the ACS. The ACS results used in describing the Boston population are subject to the limitations common to all surveys. Samples produce estimates that can never be as precise as tabulations of the whole population. Other kinds of errors can further affect the precision of estimates, and nonrandom (or systematic) error has the potential to bias findings.

Boston Public Health Commission, Boston Behavioral Risk Factor Surveillance System (BBRFSS)

The Boston Behavioral Risk Factor Surveillance System (BBRFSS) is a system of telephone health surveys of adults living in non-institutional household settings ages 18 and over that collects information on health risk behaviors, preventive health practices, and health care access primarily related to chronic disease and injury. The survey is administered in English and Spanish.

The Boston Public Health Commission (BPHC) conducts this independent survey approximately every other year modeled after the Centers for Disease Control and Prevention (CDC) Behavioral Risk Factor Surveillance System (BRFSS) survey. Over time, the survey has been modified by BPHC to be more reflective of health risk behaviors specific to the Boston population. In 2013, BBRFSS data across all data years were re-weighted to accommodate post-stratification to five population dimensions (i.e., age, gender, racial/ethnic group, education and marital status). As a result, rates, percentages, and point estimates will vary from and cannot be compared with previously produced BBRFSS results. However, the Boston Behavioral Risk Factor Surveillance System survey has maintained many standard core questions included in the BRFSS used by the Massachusetts Department of Public Health. Results from the survey are used by BPHC to plan and implement health initiatives; to identify health problems within populations; to identify racial/ethnic inequities in access to and utilization of health care, in risk behaviors, and selected health conditions; to establish and monitor health objectives; to

support health-related legislative activities; to evaluate disease prevention activities and programs; and to assist in receiving grants and other funding.

Centers for Disease Control and Prevention and Boston Public Schools, Boston Youth Risk Behavior Survey (YRBS)

The Youth Risk Behavior Surveillance System (YRBSS) is a system of national school-based surveys conducted by the Centers for Disease Control and Prevention (CDC) every other year among public high school students in grades 9-12. It is currently conducted in 47 states, 6 territories, 2 tribal governments, and 22 cities. The survey contains questions related to risk behaviors such as unintentional injuries and violence, alcohol and drug use, tobacco use, sexual behavior, unhealthy eating behaviors, physical inactivity, and the prevalence of obesity and asthma.

The Boston Public Health Commission uses results from the YRBSS to identify the prevalence of health risk behaviors among Boston youth, identify racial/ethnic inequities, plan and implement health initiatives, support health-related legislative activities, and assist in obtaining grants and other funding.

Vital Records

Massachusetts Department of Public Health, Boston Resident Live Births, Registry of Vital Records and Statistics

These data present Massachusetts birth certificate information. The recording of resident live births is considered nearly complete for Massachusetts resident births, including those that take place at home or out-of-state but to Massachusetts residents. Birth data in this report pertain only to Boston residents.

For analytical purposes, infants are assigned their mother's self-reported race/ethnicity, and not a combination of both parents' race/ethnicity.

Massachusetts Department of Public Health, Boston Resident Deaths, Registry of Vital Records and Statistics

These data present Massachusetts death certificate information. Death data used by the Boston Public Health Commission pertain only to Boston resident decedents. Cause of death determinations are typically made by the certifying physician. However, the Office of the Chief Medical Examiner is responsible for investigating the cause and manner of death occurring under violent, suspicious or unexplained circumstances. Due to delays in investigational results, cause and manner determinations may get updated after analysis of data for any given year. Additionally, certain information within the death record is obtained with the assistance of an informant, typically a family member or funeral director, which may result in errors (for example, in race/ethnicity reporting) that would not occur in self-reported data.

Infectious Disease Data

Massachusetts Department of Public Health, Bureau of Infectious Diseases and Laboratory Sciences

Data from communicable disease surveillance systems are limited by the degree to which people with a condition seek health care that results in testing and reporting to the system. Diseases may be asymptomatic or mild, or are treated presumptively without laboratory testing, and for some conditions, reporting may be less than complete. These factors may contribute to underestimates of the frequency of disease.

New cases of chlamydia, syphilis and gonorrhea infection are reported to the Massachusetts Department of Public Health and the Boston Public Health Commission by diagnosing physicians and laboratories. Undiagnosed cases and variations in screening practices, and compliance with reporting requirements may influence the accuracy of reported sexually transmitted infections.

Massachusetts Department of Public Health, HIV/AIDS Surveillance Program

New cases of HIV infection (incidence) and cases of people living with HIV/AIDS (prevalence) are reported to the Massachusetts Department of Public Health by diagnosing physicians and laboratories. Undiagnosed cases may influence the accuracy of reported cases and impede interpretation of HIV/AIDS case data.

Other Data

Acute Hospital Case-Mix Databases (Hospital Inpatient Discharge Database and Outpatient Emergency Department Database), Massachusetts Center for Health Information and Analysis

These hospital patient encounter (HPE) data present information on Boston resident hospitalizations and emergency department visits to acute care hospitals in Massachusetts. All rates are based on encounter count totals covering fiscal years running October through September (e.g., year 2015 covers HPEs from October 2014-September 2015). Data from the Outpatient Hospital Observation Discharge Database are not included in this report.

For a given HPE, the patient's primary diagnosis is used for determination of most health conditions in this report. Some specific injury-type hospitalizations and ED visits and all substance misuse hospital patient encounters are based on further consideration of multiple diagnosis levels after consideration of the primary diagnosis (See Injury and Substance Misuse Hospital Patient Encounters in Technical Notes for more information).

Hospital patient encounters: In this report, hospital patient encounters include both emergency department visits and hospitalizations.

Emergency department (ED) visit: Visits to acute-care hospital emergency departments for care. In this report, emergency department visit data includes cases seen in the emergency department that resulted in either a discharge directly from the hospital ED or from a hospitalization that followed ED care. ED visits resulting in a discharge from the observational

stay setting are excluded from this report. For Chapter 12: Injury, ED visits include only cases with a discharge from the emergency department and exclude ED visits resulting in a hospitalization.

Hospitalization: Hospitalization represents a patient's continuous stay of one night or more in the hospital for observation, care, diagnosis, or treatment before being discharged (released) from the inpatient setting by the hospital. Only hospitalizations from acute-care, non-federal hospitals have been included. In this report, hospitalizations include cases originating in the emergency department that result in inpatient hospital admissions.

Massachusetts Department of Public Health, Bureau of Substance Abuse Services

The Bureau of Substance Abuse Services at the Massachusetts Department of Public Health provides publicly-supported substance misuse treatment admissions data for Boston resident treatment clients. These data are fiscal year based (July-June). Drug-specific rates of treatment clients presented in this report reflect unique-person counts of clients identifying a specific drug as being either a primary, secondary or tertiary substance of misuse. This methodology of quantifying a given drug's exposure among the treatment client base is meant to better help identify the extent of drug-specific misuse among the client base for drugs not typically identified as a primary drug of misuse. Treatment admissions data reflect only individuals who have successfully accessed the treatment system and, therefore, do not describe the whole Boston resident drug use disorder population.

APPENDIX D. ORGANIZATIONS INVOLVED WITH BOSTON CHNA SURVEY DISSEMINATION

Organizations
2LifeCommunities
Asian Women for Health
ATASK (Asian Task Force Against Domestic Violence)
Boston Alliance for Community Health- Healthy Community Champions
Beth Israel Deaconess
Boston Children's Hospital Community Advisory Board
Boston Chinatown Neighborhood Center
Boston Health care for the Homeless
Boston HealthNet
Boston Housing Authority
Boston Latin Academy
Boston Public Health Commission
Boston Public Libraries
Boston Teacher's Union
Brigham and Women's Faulkner Hospital
Brigham and Women's Hospital
Charles River Health Center
East Boston Neighborhood Health Center
East Boston Social Centers
Franciscan Hospital
Hebrew Senior Life
International Institute of New England
ISBCC Mosque
Jamaica Plain Neighborhood Development Corporation
The LEAH Project (Leaders through Education, Action, and Hope)

Organizations
Madison Park Development Corporation
MAPS (Massachusetts Alliance of Portuguese Speakers)
Mather Elementary
Massachusetts General Hospital
Peer Health Exchange
Sampan Newspaper
The Family Van
Tufts Community Health Improvement Program
Union Capital Boston
Upham's Corner Health Center
Urban Edge

APPENDIX E. BOSTON CHNA SURVEY RESPONDENT CHARACTERISTICS

	Number	Percent
Neighborhood of Residence	2,404	
Allston/Brighton	243	10.1%
Back Bay	36	1.5%
Beacon Hill	24	1.0%
Charlestown	93	3.9%

NOTES: † denotes where respondents were allowed to select multiple responses; therefore, percentages may not sum up to 100%

APPENDIX F. FOCUS GROUP PARTICIPANT CHARACTERISTICS

Completed Focus Group Demographic Surveys Prior to the Focus Groups

	Number	Percent
Neighborhood of Residence	97	
Allston/Brighton	10	10.3%
Back Bay	0	0.0%
Beacon Hill	0	0.0%
Charlestown	0	0.0%
Chinatown	1	1.0%
Dorchester	35	36.1%
Downtown	2	2.1%
East Boston	6	6.2%
Fenway	0	0.0%
Hyde Park	3	3.1%
Jamaica Plain	3	3.1%
Mattapan	9	9.3%
North End	0	0.0%
Roslindale	3	3.1%
Roxbury	5	5.2%
South Boston	4	4.1%
South End	12	12.4%
West End	0	0.0%
West Roxbury	2	2.1%
Outside of Boston	2	2.1%
Age	98	
Under 18 years	2	2.0%
18–24 years	8	8.2%
25–44 years	36	36.7%
45–64 years	45	45.9%
65+ years	7	7.1%

	Number	Percent
Race/Ethnicity	97	
American Indian or Alaska Native	2	2.1%
Asian	3	3.1%
Black	44	45.4%
Latino	33	34.0%
Middle Eastern or North African	1	1.0%
Native Hawaiian or Other Pacific Islander	0	0.0%
White	10	10.3%
Other	2	2.1%
Multiple races	2	2.1%
Current Sex or Gender Identity	97	
Female	55	56.7%
Male	35	36.1%
Transgender male	3	3.1%
Transgender female	0	0.0%
Genderqueer, (neither exclusively male or female)	3	3.1%
Additional gender category	1	1.0%
Educational Attainment	96	
High school graduate or less	55	57.3%
Some college/certification program	29	30.2%
College graduate or more	12	12.5%

DATA SOURCE: Boston CHNA Pre-Focus Group Survey, 2019

NOTES: Racial/Ethnic categories were recoded to be mutually exclusive where Latino includes respondents who identified as Latino regardless of race, each racial category includes respondents who identified as a single race, and multiple races includes respondents who selected multiple racial categories

APPENDIX G. LIST OF FOCUS GROUP HOSTS AND/OR RECRUITING ORGANIZATIONS

Organization	Population Groups
Boston Chinatown Neighborhood Center	Chinese residents living in Chinatown
Boston Housing Authority- Franklin Hill Tenants Association	Residents living in public housing in Dorchester or Hyde Park
Boston Public Health Commission PAATHS Program	Residents in recovery or who are actively using
Boston Tenancy Project (Bay Cove)	Residents who are housing insecure (no permanent address or close to eviction) in Dorchester, Mattapan, or Roxbury
Brookview House- Shelter for Homeless Women and Children	Residents who are housing insecure (no permanent address or close to eviction) in Dorchester, Mattapan, or Roxbury
Central Boston Elder Services	Seniors (ages 60-75) with complex, challenging issues (e.g. homebound, medical complications)
Chinatown Neighborhood Council	Chinese residents living in Chinatown
Community Labor United	Female low-wage workers (e.g. housekeepers, child care workers, hotel service workers, etc.)
East Boston Social Centers	Latino residents in East Boston
Gardner Pilot Academy Adult Education Program	Immigrant parents of school aged children (5-18 years old)
International Institute of New England	Male low-wage workers
Justice Resource Institute- GLASS	LGBTQ youth (ages 14-21 years)
Mattapan Community Health Center	Haitian residents living in Mattapan
Mother's for Justice and Equality	Survivors of violence; mothers impacted by community violence
New England United for Justice	Female low-wage workers

APPENDIX H. LIST OF KEY INFORMANT INTERVIEWEES

Organization	Name	Position
Action for Boston Community Development (ABCD)	Amelia Youngstrom	Director, ABCD Brighton
Black Ministerial Alliance	Sharyn Halliday	Teen Café Coordinator and Interim Director of Education
Boston Area Rape Crisis Center	Casey Corcoran	Youth Sexual Violence Education Program Director
Boston Center for Independent Living	Bill Henning	Executive Director
Boston Chinatown Neighborhood Center	Yoyo Yau	Director of Family and Community Engagement Programs
Boston Health care for the Homeless	Georgia Thomas-Dias	Director, Family Team
Boston Medical Center	Dr. Megan Sandel	MD, Associate Director of GROW Clinic
Boston Medical Center- Grayken Center for Addiction	Michael Botticelli	Executive Director, Grayken Center for Addiction at BMC
Boston Police Department	Jimmy Chin	Deputy Superintendent
Boston Private Industry Council	Alysia Ordway	Employment Engagement Director
Boston Public Health Commission	Monica Valdes Lupi	Executive Director
Boston Public Schools	Tatiana Grant	School Nurse
Boston Public Schools	Colleen Kearns, LICSW	Restorative Justice Manager
Bowdoin Street Health Center	Dr. Jean Alves	Physician
Casa Myrna	Joanna Garcia	Bilingual Counselor
Central Boston Elder Services	Kattia Ira, Mila Spitkovsky, Jacquelyn Lewis	Long Term Support Manager; Director of Long Term Support Services; Senior Manager of Long Term Support
Climate Ready Boston	Bud Ris	Senior Advisor on Climate
Community Servings	Jean Terranova	Director of Food and Health Policy
Dimock Health Center	Dr. Minter-Jordan	CEO and President
Economic Mobility Pathways (EMPath)	Ashley Winning, Caitlin Smith	Vice President of Research and Evaluation; Director of Housing Redevelopment
Ethos	Dale Mitchell	CEO

Organization	Name	Position
Fenway Health	David Todisco	Acting Director of Behavioral Health
Greater Boston Food Bank	Rachel Zack, Jonathan Tetrault	Epidemiologist; Senior Manager of Community Initiatives
Green Justice Coalition	Rev. Mariama White-Hammond	Minister of Ecological Justice and Green Justice Coalition Fellow
Harvard Global Health Institute	Dr. Renee Salas	Physician; Clinical Instructor at Harvard Global Health Institute
Horizons for Homeless Children	Sheila O'Neil	Executive Director, Community Children's Centers & Family Partnerships
Islamic Society of Boston Cultural Center	Dr. Sara King Yilmaz	Physician
Massachusetts Department of Public Health	Monica Bharel	Commissioner
Metropolitan Area Planning Council (MAPC)	Eric Bourassa	Transportation Director
Mother's for Justice and Equality	Monalisa Smith	President
Nurtury	Jay Smith	Chief Advancement Officer
Osiris Institute	Larry Higginbottom	CEO
Pine Street Inn	Lyndia Downie	President and Executive Director
Prostate Health Education Network (PHEN)	Tom Farrington	President and Founder
Rosie's Place	Sandy Mariano	Vice President of Internal Programs
SEIU	Peter Mackinnon	President
South Cove Community Health Center	Eugene Welch	Executive Director
VIET-AID	Lisette Le	Executive Director

APPENDIX I. ADDITIONAL DATA

Population Overview

Table 37. Under 18 Age Distribution, by Boston and Neighborhood, 2013–2017

	Under 5 years	5–9 years	10–14 years	15–17 years
Boston	5.2%	4.3%	4.1%	2.7%
Allston/Brighton	3.7%	2.3%	1.8%	1.3%

NOTE: Data organized in descending order

Figure 185. Percent Population by Citizenship Status, by Boston, 2015

DATA SOURCES: U.S. Census Bureau, American Community (ACS) Survey, 1-Year Estimates, as analyzed by Boston Planning and Development Agency (BPDA) Research Division, reported in BPDA, “Our Shared Future: Charting a Path for Immigrant Advancement in a New Political Landscape,” as presented at the Boston Foundation (2017), 2015
NOTE: Undocumented share of undocumented foreign born is based on the Migration Policy Institute estimates for Massachusetts, as reported in “Profile of the Unauthorized Population: Massachusetts.” The estimate for MA was divided by the ACS estimate of non-citizens in MA. These calculated numbers are considered rough estimates in absence of existing data

Figure 186. Percent Immigration Issues Presented to MOIA Pro-Bono Legal Clinics (N=1,088), by Issue, 2015–2017

DATA SOURCE: Mayor’s Office of Immigrant Advancement (MOIA) issue tracker dataset, 2015-2017; Courtesy of MOIA
NOTE: Please note that the number of occurrences for each issue does not directly correlate to the number of constituents; The graph simply shows the number of occurrences the volunteer attorneys were presented with that immigration topic

Education

Figure 187. Educational Attainment for Population 25 Years and Over, by Boston and Neighborhood, 2013–2017

DATA SOURCE: U.S. Census, American Community Survey 5-Year Estimates, 2013–2017

NOTE: Neighborhoods as defined by Boston Public Health Commission; Back Bay includes Back Bay, Beacon Hill, Downtown, North End, and West End; South End includes South End and Chinatown

Figure 188. Graduation Rate Among Boston Public High School Students, by Students with IEPs and General Education, 2017

DATA SOURCE: Massachusetts Department of Elementary and Secondary Education, School and District Profiles, Special Education Data, 2017

NOTES: Years represent school years (e.g., 2014 represents school year 2013–2014); Students with IEPs indicates the percent of enrollment who have an Individualized Education Program (IEP)

Figure 189. Dropout Rate Among Boston Public High School Students, 2018

DATA SOURCE: Massachusetts Department of Elementary and Secondary Education, School and District Profiles, Student Dropout Rate Report, 2018

NOTES: Years represent school years (e.g., 2014 represents school year 2013-2014); Dropouts are defined as students who leave school prior to graduation for reasons other than transfer to another school, in other words, the data indicate the percentage of students in grades 9-12 who dropped out of school between July 1 and June 30 prior to the listed year and who did not return to school by the following October 1; Dropout rates are not reported for any student group where the number of students is less than 6

Figure 190. Percent of Boston Public School Students Scoring Proficient or Higher on MCAS Tests, by Test Subject and by Massachusetts and Boston, 2018

DATA SOURCE: Massachusetts Department of Elementary and Secondary Education, School and District Profiles, Assessment, MCAS Tests, 2018

NOTES: Students' scores can fall into four achievement level categories: Warning/Failing, Needs Improvement, Proficient; and Advanced; In order to earn a Competency Determination, students must achieve a score of either Proficient on the grade 10 English Language Arts and Mathematics tests, or a score of Needs Improvement, and satisfy the requirements of an Educational Proficiency Plan; for Science and Technology/Engineering (STE), students must achieve a score of Needs Improvement or higher on one of four high school STE tests

Figure 191. Percent Boston Public School Students (Grades 3–8) Scoring Meeting or Exceeding Expectations on Next Generation Massachusetts Comprehensive Assessment System (MCAS) Tests, by Test Subject and by Massachusetts and Boston, 2018

DATA SOURCE: Massachusetts Department of Elementary and Secondary Education, School and District Profiles, Assessment, Next Generation MCAS Tests, 2018
NOTES: Students' scores can fall into four achievement level categories: Not Meeting Expectations, Partially Meeting Expectation, Meeting Expectations, and Exceeding Expectations; Next Generation MCAS tests were implemented starting 2017; Students who perform at the meeting expectations level or exceeding expectations level met or exceeded grade-level expectations in the subject

Employment and Workforce

Figure 192. Percent Population 16 Years and Over Unemployed, by Boston and Race/Ethnicity, 2017

DATA SOURCE: U.S. Census, American Community Survey 1-Year Estimates, 2017
NOTE: Asterisk (*) denotes race/ethnicity estimate was significantly different compared to the Boston estimate ($p < 0.05$); Error bars show 95% confidence interval

Figure 193. Percent Boston CHNA Survey Respondents Reporting Currently Working More Than One Job for Pay (N=1,304), 2019

DATA SOURCE: Boston CHNA Community Survey, 2019
NOTE: Denominator for percentage calculations is the number of respondents who responded that they are “employed for wages” or “self-employed”

Figure 194. Percent Boston CHNA Survey Respondents Reporting Current Hours per Week Employed for Pay (N=1,297), 2019

DATA SOURCE: Boston CHNA Community Survey, 2019

NOTE: Denominator for percentage calculations is the number of respondents who responded that they are “employed for wages” or “self-employed”

Income and Financial Security

Table 43. Average and Median Household Income (in U.S. Dollars), by Boston and Zip Code, 2013–2017

Zip Code	Neighborhood	Average	Median
Boston	Boston	\$95,114	\$62,021
02134	Allston/Brighton	\$69,218	\$49,938
02135	Allston/Brighton	\$79,397	\$61,566
02163	Allston/Brighton	\$68,432	\$64,000
02108	Back Bay	\$192,935	\$126,224
02109	Back Bay	\$197,828	\$129,716
02110	Back Bay	\$256,500	\$108,438
02113	Back Bay	\$118,824	\$91,212
02114	Back Bay	\$138,702	\$89,452
02116	Back Bay	\$183,165	\$103,422
02199	Back Bay	\$165,278	\$82,238
02129	Charlestown	\$143,820	\$103,834
02121	Dorchester	\$45,874	\$27,964
02125	Dorchester	\$74,396	\$53,382
02122	Dorchester	\$73,842	\$56,024
02124	Dorchester	\$70,587	\$50,227
02128	East Boston	\$70,513	\$52,154
02115	Fenway	\$71,111	\$38,759
02215	Fenway	\$72,124	\$43,403
02136	Hyde Park	\$79,517	\$64,877
02130	Jamaica Plain	\$108,494	\$84,847
02126	Mattapan	\$66,689	\$50,039
02131	Roslindale	\$91,960	\$72,127
02119	Roxbury	\$49,233	\$30,663

Zip Code	Neighborhood	Average	Median
02120	Roxbury	\$51,456	\$32,243
02127	South Boston	\$113,153	\$91,597
02210	South Boston	\$212,297	\$170,152
02111	South End	\$112,325	\$39,329
02118	South End	\$129,325	\$70,575
02132	West Roxbury	\$113,775	\$93,343

DATA SOURCE: U.S. Census, American Community Survey 5-Year Estimates, 2013-2017

Figure 195. Percent Population Living Below 200% of Poverty Level, by Boston and Neighborhood, 2013-2017

DATA SOURCE: U.S. Census, American Community Survey 5-Year Estimates, 2013-2017

NOTE: Neighborhoods as defined by Boston Public Health Commission; Back Bay includes Back Bay, Beacon Hill, Downtown, North End, and West End; South End includes South End and Chinatown; Asterisk (*) denotes neighborhood estimate was significantly different compared to the Boston estimate ($p < 0.05$)

Figure 196. Percent Families Living Below Poverty Level, by Boston and Neighborhood, 2013–2017

DATA SOURCE: U.S. Census, American Community Survey 5-Year Estimates, 2013–2017
NOTE: Neighborhoods as defined by Boston Public Health Commission; Back Bay includes Back Bay, Beacon Hill, Downtown, North End, and West End; South End includes South End and Chinatown; Asterisk (*) denotes neighborhood estimate was significantly different compared to the Boston estimate ($p < 0.05$); Error bars show 95% confidence interval

Figure 197. Percent Families Below Poverty Level, by Boston and Race/Ethnicity, 2017

DATA SOURCE: U.S. Census, American Community Survey 1-Year Estimates, 2017
NOTE: Asterisk (*) denotes race/ethnicity estimate was significantly different compared to the Boston estimate ($p < 0.05$); Error bars show 95% confidence interval

Figure 198. Household Median Net Worth (in U.S. Dollars), by Boston Metropolitan Statistical Area, 2014

DATA SOURCE: Duke University, National Asset Scorecard for Communities of Color (NASCC), Boston NASCC survey, as analyzed and reported by Muñoz, A. P. et al, Federal Reserve Bank of Boston, The Color of Wealth in Boston (2015), 2014

NOTES: Boston Metropolitan Statistical Area includes the following Massachusetts counties: Essex County, Middlesex County, Norfolk County, and Suffolk County, and Rockingham County, New Hampshire and Strafford County, New Hampshire; Wealth or net worth is measured by the difference between one's assets and debts or liabilities; The "not elsewhere classified" (NEC) category includes mainly respondents that chose more than one race; NA denotes where values for Cape Verdeans were not calculated because sample sizes were too small; This study focused on U.S. born Black, Caribbean Black, Cape Verdean, Puerto Rican, and Dominican differences and did not report data on other racial/ethnic groups

Table 44. Gini Index, by Boston and Zip Code, 2013–2017

Zip Code	Neighborhood	Index
Boston	Boston	0.5425
02134	Allston/Brighton	0.5015
02135	Allston/Brighton	0.4781
02163	Allston/Brighton	0.4218
02108	Back Bay	0.5141
02109	Back Bay	0.5293
02110	Back Bay	0.6427
02113	Back Bay	0.4462
02114	Back Bay	0.5396
02116	Back Bay	0.5923
02199	Back Bay	0.5671
02129	Charlestown	0.5248
02121	Dorchester	0.5479
02125	Dorchester	0.5051
02122	Dorchester	0.4558
02124	Dorchester	0.4959
02128	East Boston	0.4648
02115	Fenway	0.6055
02215	Fenway	0.6083
02136	Hyde Park	0.4482
02130	Jamaica Plain	0.4812

Zip Code	Neighborhood	Index
02126	Mattapan	0.4695
02131	Roslindale	0.4557
02119	Roxbury	0.5422
02120	Roxbury	0.5464
02127	South Boston	0.4701
02210	South Boston	0.4172
02111	South End	0.6689
02118	South End	0.5914
02132	West Roxbury	0.4308

DATA SOURCE: U.S. Census, American Community Survey 5-Year Estimates, 2013-2017

NOTE: The Gini Index is a summary measure of income inequality. The Gini coefficient incorporates the detailed shares data into a single statistic, which summarizes the dispersion of income across the entire income distribution. The Gini coefficient ranges from 0, indicating perfect equality (where everyone receives an equal share), to 1, perfect inequality (where only one recipient or group of recipients receives all the income). The Gini is based on the difference between the Lorenz curve (the observed cumulative income distribution) and the notion of a perfectly equal income distribution

Figure 199. Average Credit Score, by Boston and Neighborhoods, 2017

DATA SOURCE: Federal Reserve Bank of New York (FRBNY) Consumer Credit Panel/Equifax, as cited in Federal Reserve Bank of Boston, The Concentration of Financial Disadvantage: Debt Condition and Credit Report Data in Massachusetts Cities and Boston Neighborhoods (2018), 2017Q2

NOTE: Neighborhoods are defined per Boston Planning & Development Authority definitions (<http://www.bostonplans.org/getattachment/d09af00c-2268-437b-9e40-fd06d0cd20a2>)

Figure 200. Percent Boston CHNA Survey Respondents Reporting Having Trouble with Paying Credit Card Bills, by All Respondents and Selected Indicators, 2019

DATA SOURCE: Boston CHNA Community Survey, 2019

NOTE: Chi-square analyses were conducted and there were statistically significant differences within the following groups ($p < 0.05$): race/ethnicity, age, gender identity, educational attainment, sexual orientation, and parent status

Food Insecurity

Figure 201. Percent Boston CHNA Survey Respondents Reporting They Chose Fast Food Because It Was Cheaper Than Other Options in Past Month (N=1,796), by Frequency, 2019

DATA SOURCE: Boston CHNA Community Survey, 2019

NOTES: Never/rarely includes respondents who selected “never/rarely” or “1-3 times per month (less than once per week),” Sometimes includes respondents who selected “1-2 times per week,” and Often includes respondents who selected “3-4 times per week,” “5-6 times per week,” or “1+ times per day;” Question was worded: “In the past month, how often did you choose fast food (such as McDonalds, KFC, or Wendy’s) because it was cheaper than other options?”; Percentage calculations do not include respondents who selected “prefer not to answer”

Figure 202. Percent Adults Reporting Food Purchased Did Not Last and Did Not Have Money to Get More, by Boston and Over Time, 2010–2017

DATA SOURCE: Boston Public Health Commission, Boston Behavioral Risk Factor Surveillance System, 2010, 2013, 2015, and 2017
DATA ANALYSIS: Boston Public Health Commission, Research and Evaluation Office
NOTE: Data show percentage of adults reporting it was sometimes or often true that the food didn't last and they did not have money to get more; Error bars show 95% confidence interval; Change over time was statistically significant (decrease over time)

Figure 203. Percent Adults Reporting Food Purchased Did Not Last and Did Not Have Money to Get More, by Boston and Neighborhood, 2013, 2015 and 2017 Combined

DATA SOURCE: Boston Public Health Commission, Boston Behavioral Risk Factor Surveillance System, 2013, 2015, and 2017 combined
DATA ANALYSIS: Boston Public Health Commission, Research and Evaluation Office
NOTE: Data show percentage of adults reporting it was sometimes or often true that the food didn't last and they did not have money to get more; Asterisk (*) denotes where neighborhood estimate was significantly different compared to the rest of Boston ($p < 0.05$); Error bars show 95% confidence interval

Figure 204. Percent Population Food Insecure, by Boston and Neighborhoods, 2016

DATA SOURCE: Gundersen, C., A. Dewey, A. Crumbaugh, M. Kato & E. Engelhard. Map the Meal Gap 2018: A Report on County and Congressional District Food Insecurity and County Food Cost in the United States in 2016, Feeding America, Courtesy of The Greater Boston Food Bank, 2016

NOTE: Neighborhoods are defined per Boston Planning & Development Authority definitions; Food insecurity is defined as the household-level economic and social condition of limited or uncertain access to adequate food. Data from the Current Population Survey and Bureau of Labor Statistics (e.g., unemployment, poverty, homeownership, and other demographic variables) are assessed in relation to food insecurity to produce state-level estimates of food insecurity, from which county-level estimates are derived.

Figure 205. Percent Boston CHNA Survey Respondents Reporting That It Was Sometimes or Often True That They Worried That Their Food Would Run Out Before They Got Money to Buy More in Past 12 Months, by All Respondents and Primary Language Spoken, 2019

DATA SOURCE: Boston CHNA Community Survey, 2019

NOTES: Question was worded: "In the last 12 months, have you worried that your food would run out before you got money to buy more?" and respondents were asked to select one of the following response options: often true, sometimes true, never true, and prefer not to answer; Percentage calculations do not include respondents who selected "prefer not to answer"

Figure 206. Percent Boston CHNA Survey Respondents Reporting That They Worried That Their Food Would Run Out Before They Got Money to Buy More in Past 12 Months (N=1,893), 2019

DATA SOURCE: Boston CHNA Community Survey, 2019
NOTES: Question was worded: “In the last 12 months, have you worried that your food would run out before you got money to buy more?” and respondents were asked to select one of the following response options: often true, sometimes true, never true, and prefer not to answer; Percentage calculations do not include respondents who selected “prefer not to answer”

Figure 207. Percent Adults Reporting Feeling Hungry But Did Not Eat Because Could Not Afford Food, by Boston and Neighborhood, 2010–2017

DATA SOURCE: Boston Public Health Commission, Boston Behavioral Risk Factor Surveillance System, 2010, 2013, 2015, and 2017
DATA ANALYSIS: Boston Public Health Commission, Research and Evaluation Office
NOTE: Data show percentage of adults reporting it was sometimes or often true in the past 12 months they remained hungry because they could not afford food; Error bars show 95% confidence interval; Change over time was not statistically significant

Figure 208. Percent Adults Reporting Feeling Hungry But Did Not Eat Because Could Not Afford Food, by Boston and Selected Indicators, 2013, 2015, and 2017 Combined

DATA SOURCE: Boston Public Health Commission, Boston Behavioral Risk Factor Surveillance System, 2013, 2015, and 2017 combined

DATA ANALYSIS: Boston Public Health Commission, Research and Evaluation Office

NOTES: Data show percentage of adults reporting it was sometimes or often true in the past 12 months they remained hungry because they could not afford food; Bars with pattern indicate reference group for its specific category; Asterisk (*) denotes where estimate was significantly different compared to reference group within specific category ($p < 0.05$); Error bars show 95% confidence interval

Figure 209. Percent Adults Reporting Feeling Hungry But Did Not Eat Because Could Not Afford Food, by Boston and Neighborhood, 2013, 2015, and 2017 Combined

DATA SOURCE: Boston Public Health Commission, Boston Behavioral Risk Factor Surveillance System, 2013, 2015, and 2017 Combined

DATA ANALYSIS: Boston Public Health Commission, Research and Evaluation Office

NOTE: Data show percentage of adults reporting it was sometimes or often true in the past 12 months they remained hungry because they could not afford food; NA denotes where data not presented due to insufficient sample size; Asterisk (*) denotes where neighborhood estimate was significantly different compared to the rest of Boston ($p < 0.05$); Error bars show 95% confidence interval

Housing

Figure 210. Housing Tenure, by Boston and Neighborhood, 2013–2017

DATA SOURCE: U.S. Census, American Community Survey 5-Year Estimates, 2013–2017

NOTE: Neighborhoods as defined by Boston Public Health Commission; Back Bay includes Back Bay, Beacon Hill, Downtown, North End, and West End; South End includes South End and Chinatown

Figure 211. Housing Tenure, by Boston and Race/Ethnicity of Householder, 2017

DATA SOURCE: U.S. Census, American Community Survey 1-Year Estimates, 2017

Table 45. Median Monthly Housing Costs, by Boston and Zip Code, 2013–2017

	Neighborhood	Owner with Mortgage	Owner without Mortgage	Renter

NOTES: Neighborhoods as defined by Boston Planning and Development Agency; NA denotes where data were not available

Figure 212. Percent Boston CHNA Survey Respondents Reported Main Reasons for Most Recent Move in Past Five Years If They Have Moved (N=977), 2019

DATA SOURCE: Boston CHNA Community Survey, 2019

NOTE: Data arranged in descending order; Percentage calculations do not include respondents who selected “did not move” or “prefer not to answer/don’t know”

Table 47. Number of Non-Permanent Housing in Boston, by Bed Type, 2018

Housing Type	Bed Type			Total Year-round Beds
	Family Beds	Adult-Only Beds	Child-Only Beds	
Emergency, Safe Haven, and Transitional Housing	3,939	2,045	4	5,988
Emergency Shelter	3,758	1,603	4	5,365
Safe Haven	NA	60	NA	60
Transitional Housing	181	382	0	563
Total	7,878	4,090	8	11,976

DATA SOURCE: U.S. Department of Housing and Urban Development, Continuums of Care, Continuum of Care Homeless Assistance Programs Housing Inventory Count Report, 2018

NOTES: HUD’s point-in-time count does not include persons or beds in Permanent Supportive Housing as currently homeless; Family Beds include beds for households with one adult and at least one child under age 18; NA denotes where data were not available

Figure 213. Number of Homeless Individuals Living in Boston, by Race and Over Time, 2015–2018

DATA SOURCE: U.S. Department of Housing and Urban Development, Continuums of Care, HUD Continuum of Care Homeless Assistance Programs Homeless Populations and Sub Populations, 2015-2018

NOTES: Data include counts of homeless individuals in emergency shelters, transitional housing, and unsheltered; Safe Haven programs are included in the Transitional Housing category; Asian, American Indian or Alaska Native, and Native Hawaiian or Other Pacific Islander categories were collapsed into the Other category due to counts of less than 100 in each category at each time point

Figure 214. Number of Homeless Individuals Living in Boston, by Ethnicity and Over Time, 2015–2018

DATA SOURCE: U.S. Department of Housing and Urban Development, Continuums of Care, HUD Continuum of Care Homeless Assistance Programs Homeless Populations and Sub Populations, 2015-2018

NOTES: Data include counts of homeless individuals in emergency shelters, transitional housing, and unsheltered; Safe Haven programs are included in the Transitional Housing category

Figure 215. Percent Boston CHNA Survey Respondents Reported Having Trouble Paying Monthly Utilities, by All Respondents and Selected Indicators, 2019

DATA SOURCE: Boston CHNA Community Survey, 2019

NOTE: Chi-square analyses were conducted and there were statistically significant differences within the following groups ($p < 0.05$): race/ethnicity, age, gender identity, educational attainment, and parent status

Transportation

Table 48. Means of Transportation to Work for Population 16 Years and Over, by Boston and Neighborhood, 2013–2017

	Car, truck, van – alone	Car, truck, van – carpool	Public transportation	Walked	Other
Boston	39.0%	5.8%	33.6%	14.6%	6.9%

02118	South End	\$1,385
02132	West Roxbury	\$1,336

DATA SOURCE: Carinsurance.com

NOTES: CarInsurance.com commissioned Quadrant Information Services to provide a report of average auto insurance rates for a 2016 Honda Accord for nearly every ZIP code in the United States. We calculated rates using data for up to six large carriers (Allstate, Farmers, GEICO, Nationwide, Progressive and State Farm); Averages for the default result are based on insurance for a married 40-year-old male who commutes 12 miles to work each day, with policy limits of 100/300/100 (\$100,000 for injury liability for one person, \$300,000 for all injuries and \$100,000 for property damage in an accident) and a \$500 deductible on collision and comprehensive coverage. The rate includes uninsured motorist coverage. Averages for customized rates are based on drivers ages 20, 30, 40, 50, 60 and 70 for the following coverage levels: state minimum liability, liability of 50/100/50 and 100/300/100 with \$500 deductible on comprehensive and collision. These hypothetical drivers have clean records and good credit. Average rates are for comparative purposes.

Table 50. Percent Boston CHNA Survey Respondents Reported Transportation Barriers to Getting to Medical Appointments, Meetings, Work, or Getting Things Needed for Daily Living, By Selected Neighborhoods, 2019

Allston/ Brighton (N=202)	Chinatown (N=64)	Dorchester (N=460)	East Boston (N=174)	Hyde Park (N=84)	Jamaica Plain (N=76)	Mattapan (N=81)	Roslindale (N=127)	Roxbury (N=150)	South End (N=99)

DATA ANALYSIS: Boston Public Health Commission, Research and Evaluation Office

NOTES: Sample sizes for Back Bay, Dorchester (02121, 02125), Dorchester (02122, 02124), East Boston, and Fenway are ≤ 20 and rates should be interpreted with caution Asterisk (*) denotes where neighborhood estimate was significantly different compared to the rest of Boston ($p < 0.05$)

Mental Health

Figure 252. Percent Adults Reporting Persistent Sadness, by Boston and Neighborhood, 2013, 2015, and 2017 Combined

DATA SOURCE: Boston Public Health Commission, Boston Behavioral Risk Factor Surveillance System, 2013, 2015, and 2017 combined
DATA ANALYSIS: Boston Public Health Commission, Research and Evaluation Office
NOTES: Persistent sadness is defined as feeling sad, blue, or depressed for more than 15 days within the past 30 days; Asterisk (*) denotes where neighborhood estimate was significantly different compared to the rest of Boston ($p < 0.05$); Error bars show 95% confidence interval

Figure 253. Percent Adults Reporting Persistent Sadness, by Boston and Over Time, 2010-2017

DATA SOURCE: Boston Public Health Commission, Boston Behavioral Risk Factor Surveillance System, 2010, 2013, 2015, and 2017
DATA ANALYSIS: Boston Public Health Commission, Research and Evaluation Office
NOTES: Persistent sadness is defined as feeling sad, blue, or depressed for more than 15 days within the past 30 days; Error bars show 95% confidence interval; Change over time was not statistically significant

Figure 254. Percent Adults Reporting Persistent Anxiety, by Boston and Neighborhood, 2013, 2015, and 2017 Combined

DATA SOURCE: Boston Public Health Commission, Boston Behavioral Risk Factor Surveillance System, 2013, 2015, and 2017 Combined

DATA ANALYSIS: Boston Public Health Commission, Research and Evaluation Office

NOTES: Persistent anxiety is defined as feeling worried, tense, or anxious for more than 15 days within the past 30 days; Asterisk (*) denotes where neighborhood estimate was significantly different compared to the rest of Boston ($p < 0.05$); Error bars show 95% confidence interval

Figure 255. Percent Adults Reporting Persistent Anxiety, by Boston and Over Time, 2010–2017

DATA SOURCE: Boston Public Health Commission, Boston Behavioral Risk Factor Surveillance System, 2010, 2013, 2015, and 2017

DATA ANALYSIS: Boston Public Health Commission, Research and Evaluation Office

NOTE: Persistent Anxiety is defined as feeling worried, tense, or anxious for more than 15 days within the past 30 days; Error bars show 95% confidence interval; Change over time was statistically significant (increase over time)

Figure 256. Percent Boston CHNA Survey Respondents Reporting Anxiety and Sadness in Past 30 Days, 2019

DATA SOURCE: Boston CHNA Community Survey, 2019

NOTE: Percentage calculations do not include respondents who responded “prefer not to answer/don’t know”

Figure 257. Percent Boston CHNA Survey Respondents Reporting Feeling Worried, Tense, or Anxious For 10 Days or More in Past 30 Days, by All Respondents and Selected Indicators, 2019

DATA SOURCE: Boston CHNA Community Survey, 2019

NOTE: Percentage calculations do not include respondents who responded “not applicable/don’t know”; Chi-square analyses were conducted and there were statistically significant differences within the following groups ($p < 0.05$): race/ethnicity, age, gender identity, educational attainment, and sexual orientation

Figure 258. Percent Boston CHNA Survey Respondents Reporting Feeling Sad, Blue, or Depressed For 10 Days or More in Past 30 Days, by All Respondents and Selected Indicators, 2019

DATA SOURCE: Boston CHNA Community Survey, 2019

NOTE: Percentage calculations do not include respondents who responded “not applicable/don’t know”; Chi-square analyses were conducted and there were statistically significant differences within the following groups ($p < 0.05$): race/ethnicity, age, gender identity, and sexual orientation

Figure 259. Suicide Rate, by Boston and Neighborhood, Age-Adjusted Rate per 100,000 Residents, 2012–2016 Combined

DATA SOURCE: Massachusetts Department of Public Health, Boston resident deaths, 2012–2016 Combined

DATA ANALYSIS: Boston Public Health Commission, Research and Evaluation Office

NOTES: Back Bay includes Back Bay, Beacon Hill, Downtown, North End, and West End; South End includes South End and Chinatown; NA denotes where data not presented due to insufficient sample size; All neighborhood sample sizes excluding Dorchester (02122, 02124) are < 20 and rates should be interpreted with caution; Asterisk (*) denotes where neighborhood estimate was significantly different compared to the rest of Boston ($p < 0.05$)

While the JP rate is the same as Dorchester, it is not statistically significant due to a wider variance.

DATA SOURCE: 2019 Boston CHNA Survey

Priority	Boston Medical Center Programs and Initiatives	Description of Programs and Services	FY18 Progress, Impact, Outcomes
Priority 1: HEALTH CARE ACCESS	1. Birth Sisters and Centering Pregnancy 2. Comprehensive Care Program for Children (CCP) 3. Elders Living at Home Program (ELAHP) 4. The Grow Clinic 5. The Preventive Food Pantry and Teaching Kitchen 6. Transportation Services (Uber Health and Shuttle Buses) 7. Supporting Parents and Resilient Kids Center (SPARK)	1. Birth Sisters, women who are trained to provide social support and education to mothers from their own communities during pregnancy, labor, and the postpartum period, help improve health outcomes of childbearing women at risk for poor maternal and infant outcomes. 2. The CCP program provides children with special healthcare needs wraparound services. 3. ELAHP provides tailored housing services including housing stabilization, agency referrals. 4. The Grow Clinic is an outpatient subspecialty clinic that provides comprehensive specialty medical, nutritional development, social services and dietary assistance to children. 5. The Food Pantry addresses nutrition-related illness and under-nutrition for low-income patients by providing them prescriptions for supplemental foods that best promote physical health. The Teaching Kitchen offers free cooking classes to promote a healthier lifestyle and better manage health. 6. Transportation services improve patients' access to healthcare. 7. SPARK gives children with medical, emotional and/or behavioral challenges the skills needed to succeed in school and develop productive and rewarding adult lives.	1. Birth Sisters served over 300 patients. 2. The CCP served 500 children and their families. 3. ELAHP served 211 clients. Over the last 10 years, the success rate of ELAHP stabilization services have been 98%. 4. The Grow Clinic served 200 patients, including 79 new patients. Clinicians made 429 home visits. Eighty percent of patients demonstrated significant weight improvement. 5. The Food Pantry filled 6,794 monthly food prescriptions. 6. 156,483 patients used the shuttle buses as their transportation to/from their appointments. 7. SPARK served 40-50 children.
Priority 2: CHRONIC DISEASES AND RISK FACTORS	1. Patient Navigation	1. Patient Navigation provides advocacy and case management to oncology patients who have at least one identified barrier to care.	1. Navigators worked with 1,000 unique patients.
Priority 3: MENTAL HEALTH AND SUBSTANCE ABUSE	1. Center for Addiction Treatment for AdoLescent/Young adults who use Substances (CATALYST) 2. TEAM UP (Transforming and Expanding Access to Mental Health Care In	1. CATALYST utilizes a developmentally-appropriate Office-Based Addiction Treatment model for youth. 2. TEAM UP builds the capacity of three local community health centers to deliver high quality, timely, evidence-based integrated behavioral health care to children and families. 3. Project ASSERT provides greater access to substance use treatment in the Emergency Department setting and includes a variety of social and community health support	1. The CATALYST Clinic received approximately 191 referrals. 2. TEAM UP partnered with Codman Square Health Center, the Dimock Center, and the Lowell Community Health Center to improve the well-being of children with behavioral health issues. 3. Project ASSERT's Licensed

	Urban Pediatrics): The Child Mental Health Initiative 3. Project Alcohol & Substance Abuse Services, Education, and Referral to Treatment (ASSERT)	services.	Alcohol and Drug Counselors had 3,703 patient visits which resulted in: placement of 1,201 unique patients in detox/acute treatment services; referral of 1,679 unique patients to NA/AA; and provision of recovery services to 201 unique patients.
Priority 4: VIOLENCE AND TRAUMA	1. Immigrant and Refugee Health Program (IRHP) 2. Community Violence Response Team (CVRT) 3. Child Witness to Violence (CWTv) 4. Domestic Violence Program (DVP) 5. Violence Intervention Advocacy Program (VIAP)	1. The Immigrant and Refugee Health Program provides comprehensive, culturally appropriate, integrated primary care services to immigrant and refugee populations and those seeking asylum, and promotes dignity, social justice, and human rights. 2. The Community Violence Response Team serves victims of community violence and their families, and survivors of homicide victims. CVRT provides family-focused clinical services including crisis intervention, advocacy, case management, and trauma-focused counseling for adults, adolescents, and children. 3. The Child Witness to Violence Project team provides short- and long-term evidence based mental health counseling, outreach, and consultation. 4. DVP Safety and Support Advocates provide victims and survivors with crisis intervention/counseling; risk assessment and safety planning; assistance with accessing protective orders and victim compensation; accompaniment to court, legal, medical, housing and other appointments; referral to community-based DV advocacy/rape crisis counseling, medical/mental health services; emergency financial assistance; and other support as needed; DVP staff provide training and education for staff, students, and community groups for those interested in learning more about domestic violence and our role in addressing it. 5. A Violence Intervention Advocate helps victims of violence avoid future violence and build a positive future by providing case management, safety planning, counseling, job and educational training and connecting them to mental health and family support services.	1. IRHP worked with over 400 new patients and has a long term primary care population of almost 2000. 2. CVRT worked with more than 1,000 individuals and families. 3. CWVP offered long-term clinical care to 300 families. The staff also delivered numerous statewide and national training efforts. 4. In addition to supporting victims and survivors, DVP also provided Massachusetts Department of Public Health-approved training to just over 1,000 providers on how to support survivors of domestic violence safely and effectively. 5. VIAP served more than 475 individuals and the recidivism rate among those served was 7%, which is considerably lower than the national average.
